Developing a 21st Century Neuroscience

Workforce Institute of Medicine, Board on Health Sciences Policy, Forum on Neuroscience and Nervous System Disorders, 2015-08-26 From its very beginning neuroscience has been fundamentally interdisciplinary As a result of rapid technological advances and the advent of large collaborative projects however neuroscience is expanding well beyond traditional subdisciplines and intellectual boundaries to rely on expertise from many other fields such as engineering computer science and applied mathematics This raises important questions about how to develop and train the next generation of neuroscientists to ensure innovation in research and technology in the neurosciences In addition the advent of new types of data and the growing importance of large datasets raise additional questions about how to train students in approaches to data analysis and sharing These concerns dovetail with the need to teach improved scientific practices ranging

from experimental design e g powering of studies and appropriate blinding to improved sophistication in statistics Of equal importance is the increasing need not only for basic researchers and teams that will develop the next generation of tools but also for investigators who are able to bridge the translational gap between basic and clinical neuroscience Developing a 21st Century Neuroscience Workforce is the summary of a workshop convened by the Institute of Medicine s Forum on Neuroscience and Nervous System Disorders on October 28 and 29 2014 in Washington DC to explore future workforce needs and how these needs should inform training programs Workshop participants considered what new subdisciplines and collaborations might be needed including an examination of opportunities for cross training of neuroscience research programs with other areas In addition current and new components of training programs were discussed to identify methods for enhancing data handling and analysis capabilities increasing scientific accuracy and improving research practices This report highlights the presentation and discussion of the workshop **Computational Neuroscience** Eric L.

Schwartz,1993-08-26 The thirty original contributions in this book provide a working definition ofcomputational neuroscience as the area in which problems lie simultaneously within computerscience and neuroscience They review this emerging field in historical and philosophical overviewsand in stimulating summaries of recent results Leading researchers address the structure of thebrain and the computational problems associated with describing and understanding this structure atthe synaptic neural map and system levels The overview chapters discuss the early days of thefield provide a philosophical analysis of the problems associated with confusion between brainmetaphor and brain theory and take up the scope and structure of computationalneuroscience Synaptic level structure is addressed in chapters that relate the properties ofdendritic branches spines and synapses to the biophysics of computation and provide a connectionbetween real neuron architectures and neural network simulations The network level chapters take upthe preattentive perception of 3 D forms oscillation in neural networks the neurobiologicalsignificance of new learning models and the analysis of neural assemblies and local learningrides Map level structure is explored in chapters on the bat echolocation system cat orientationmaps primate stereo vision cortical cognitive maps dynamic remapping in primate visual cortex andcomputer aided reconstruction of topographic and columnar maps in primates The system level chaptersfocus on the oculomotor system VLSI models of early vision schemas for high level vision goal directed movements modular learning effects of applied electric current fields on corticalneural activity neuropsychological studies of brain and mind and an information theoretic view ofanalog representation in striate cortex Eric L Schwartz is Professor of Brain Research and ResearchProfessor of Computer Science Courant Institute of Mathematical Sciences New York UniversityMedical Center Computational Neuroscience is included in the System Development FoundationBenchmark Series **Essentials of Cognitive Neuroscience** Bradley R. Neurobiology of the Axon in Health and Disease Maren Engelhardt, Vann Bennett, 2019-11-04 Ever since Santiago Ramón y Cajal sketched his captivating panels of the microscopic structure of the brain with its vast diversity of neuronal morphology over a century ago scientists have been drawn to this seemingly chaotic network of neurites and processes to uncover how structure relates to function During the course of a century we have moved from merely describing neuronal and glial morphology to furthering our understanding of such intricate processes as organelle and factor transport cellular compartmentalization neuronal polarity cytoskeleton dynamics neurite pathfinding and the impact of pathophysiological insult on these structures and events Yet to this day and likely for the foreseeable future much work remains to be done to fully grasp the exceptional role of neurites for the function of larger neuronal ensembles and networks While the somatodendritic domain of neurons has been in the focus of attention for many years mostly because of its great dynamic remodeling capacity during events of plasticity e.g. learning the axonal domain has somehow remained in the background despite the fact that especially recent comprehensive studies from various fields of research underline the axon's contribution to dynamic plasticity processes Consequently this Research Topic focuses on the many exciting aspects of axonal neurobiology ranging from membrane composition and molecular determination during development to axonal domain specialization and physiology in health and disease In Chapter 1 Axons in the PNS Bombeiro et al use immunodeficient mice to study the role of lymphocytes during the regeneration of peripheral nerves showing that the modulation of immune responses after injury can be an efficient approach to enhance nerve regeneration in the PNS Using a DRG model Berbusse et al identify the onset of damage to mitochondrial structure and dynamics as a key event during early axon degeneration and provide evidence that Nmnat1 a member of the family of nicotinamide nucleotide adenyllyltransferases can have protective effects by preserving normal mitochondrial integrity and dynamics In another study of PNS nerve regeneration Law et al use proteomics approaches via Mass Spectrometry to provide evidence that rosvatine a synthetic purine nucleoside analog can successfully promote PNS axon regeneration In Chapter 2 Axonal development in the central nervous system Yoshimura et al analyze specialized axonal domains namely the axon initial segment and nodes of Ranvier with regards to their expression profiles of the major scaffolding protein IV spectrin Super resolution microscopy reveals a potential developmental switch of spectrin isoforms at both axonal domains In a related study also using super resolution microscopy Leterrier et al examine a potential reciprocal role of membrane partners in ankyrin G targeting and

stabilization at the axonal membrane during development. The authors demonstrate a tight and precocious association of ankyrin G with its membrane partners. Hfflin et al address the question of axon initial segment morphology across different cell classes in cortical organotypic slice cultures and find a surprising heterogeneity especially between pyramidal cells and interneurons in primary visual cortex. In a major step towards establishing a successful live label of the axon initial segment, Dumitrescu et al report the development of a genetically encoded construct consisting of a voltage gated sodium channel intracellular domain fused to yellow fluorescent protein YFP. NaVII III Nelson and Jenkins then provide a comprehensive Review article on the axon initial segment and nodes of Ranvier with a special focus on the various scaffolding protein isoforms and their role in human disease. In Chapter 3 Axonal physiology and plasticity, Nikitin et al investigate fast onset dynamics of action potentials during neuronal development in vitro showing that encoding of high frequencies improves upon culture maturation accompanied by the development of passive electrophysiological properties and action potential generation. Using pharmacological and RNA interference approaches, Tapia et al provide evidence that cannabinoid receptors and their ligands can modulate dendritic morphology and thus indirectly also affect ankyrin G accumulation at the axon initial segment. A Mini Review by Zbili et al discusses the potential impact of subthreshold changes in presynaptic membrane potential before action potential initiation on neurotransmitter release and which significant impact such mechanisms could have on information processing in neuronal circuits. Yamada and Kuba close this chapter with a Mini Review on axon initial segment plasticity with a particular focus on ion channels and the biophysics of excitability. In Chapter 4 Axon degeneration and regeneration, Hamada et al investigate the often overlooked question to which extent myelin loss affects action potential propagation along distal branch points and axon collaterals. Using the cuprizone demyelination model and optical voltage sensitive dye imaging, the authors uncover functional consequences of demyelination that reach well beyond the main axon. In a model of mild traumatic brain injury, Vascak et al demonstrate complex aspects of this injury type on neocortical circuit function including changes in inhibitory perisomatic input and axon initial segment driven output in affected layer V neurons. In a Mini Review, Grosch et al discuss recent advances in the field of Parkinson's disease with a focus on early degeneration in dopaminergic and serotonergic neurons of the basal ganglia. The last two articles cover the topic of axonal regeneration. Li et al investigate the role of activated astrocytes in spinal cord lesion and how their functional downregulation via an inhibitor of mitochondrial fission, Mdivi 1 could potentially have positive impact on lesion scar formation and axonal regeneration. In a final Review, Liu et al highlight recent advances in the development of biomaterial scaffolds and cell transplantation strategies to combine two promising therapeutic approaches for spinal cord injury.

The book's organization by function frees students from having to become familiar with specific structures and thereby provides a better delineation of dynamic topics such as sensory encoding, feedback, adaptation, network interactions, and deterministic chaos.
