Prave, Eero J. Hanski, Anthony E. Fallick, Aivo Lepland, Lee R. Kump, Harald Strauss, 2012-10-11

Earth's present day environments are the outcome of a 4.5 billion year period of evolution reflecting the interaction of global scale geological and biological processes punctuated by several extraordinary events and episodes that perturbed the entire Earth system One of the earliest and arguably greatest of these events was a substantial increase orders of magnitude in the atmospheric oxygen abundance sometimes referred to as the Great Oxidation Event

Volume 2 The Core Archive of the Fennoscandian Arctic Russia Drilling Early Earth Project provides a description of the newly generated archive hosting ICDP's FAR DEEP drill cores through key geological formations in Russian Fennoscandia The book contains several hundred high quality representative photographs illustrating 3650 m of fresh uncontaminated core documenting a series of global palaeoenvironmental upheavals linked to the Great Oxidation Event The core exhibits sedimentary and volcanic formations that record a transition from anoxic to oxic Earth surface environments the first global glaciation the Huronian glaciation an unprecedented perturbation of the global carbon cycle the Lomagundi-Jatuli Event a radical increase in the size of the seawater sulphate reservoir an apparent upper mantle oxidising event the Earth's earliest documented sedimentary phosphates one of the greatest accumulations of organic matter the Shunga Event and generation of the Earth's earliest supergiant petroleum deposit The volume highlights the potential of the FAR DEEP core archive for future research of the Great Oxidation Event and the biogeochemical cycles operating during that time Welcome to the illustrative journey through one of the most exciting periods of planet Earth

Kruijt, 2009 *Earth, Our Living Planet* Philippe Bertrand, Louis Legendre, 2021-04-21 Earth is to our knowledge the only life bearing body in the Solar System This extraordinary characteristic dates back almost 4 billion years How to explain that Earth is teeming with organisms and that this has lasted for so long What makes Earth different from its sister planets Mars and Venus The habitability of a planet is its capacity to

allow the emergence of organisms What astronomical and geological conditions concurred to make Earth habitable 4 billion years ago and how has it remained habitable since What have been the respective roles of non biological and biological characteristics in maintaining the habitability of Earth This unique book answers the above questions by considering the roles of organisms and ecosystems in the Earth System which is made of the non living and living components of the planet Organisms have progressively occupied all the habitats of the planet diversifying into countless life forms and developing enormous biomass over the past 3.6 billion years In this way organisms and ecosystems took over the Earth System and thus became major agents in its regulation and global evolution There was co evolution of the different components of the Earth System leading to a number of feedback mechanisms that regulated long term Earth conditions For millennia and especially since the Industrial Revolution nearly 300 years ago humans have gradually transformed the Earth System Technological developments combined with the large increase in human population have led in recent decades to major changes in the Earth's climate soils biodiversity and quality of air and water After some successes in the 20th century at preventing internationally environmental disasters human societies are now facing major challenges arising from climate change Some of these challenges are short term and others concern the thousand year evolution of the Earth's climate Humans should become the stewards of Earth
