

# EINSTEIN'S THEORY OF RELATIVITY

There are two Theories of Relativity, the Special and the General. The Special Theory shows that motion in a straight line at constant speed is always relative to any observer. The General Theory extends the Special Theory to motion in accelerated motion (constant or changing speed in every direction path).

## SPECIAL THEORY OF RELATIVITY

Based on a basic assumption the speed of light is always the same regardless of the speed of the light source or observer. This has not accounted for unknown conditions.

Document ID: 1234567890

1. A man is riding on a moving train, and is timing a ray of light that travels from a source to the ceiling for a mirror on the floor and back to the ceiling. From his point of view that light source and the mirror are stationary, as the light travels directly back and will be perfectly reflected.

From the point of view of a stationary observer standing outside the train, the light source and the mirror are moving so the light follows a path in the shape of a  $\wedge$ . This path is longer than the one observed by the man in the train. Since light travels at the same speed for any observer, from the stationary point of view the ray takes longer than from the perspective of the man in the train. Or, in other words, time passes slower for the man in the train than for the stationary observer. So, there is no measuring the concept of absolute time. Time is relative to the observer.

卷之三

1 The man in the train is now trying to measure the length of the car by sending a key of light from one end to the other. Knowing the speed of light and the time the key takes to travel the distance, he can calculate the length of the car.

From the point of view of the stationary observer the end of the train is moving to meet the ray of light, so it has to travel a shorter distance. The stationary observer will perceive a shorter length for the car than the man in the train. So, there is no need to invoke the concept of absolute length. Length is relative to the observer.

## GENERAL THEORY OF RELATIVITY

The theory asserts that accelerated motion is relative to the observer, as the Special Theory did for the uniform motion. It shows that inertia like force that press you against the back of your seat when you sit accelerated and gravity are experienced forces, two sides of the same phenomenon.

A stage is reached at which the cell is multiplying constituents of a significant rate. The larger the experiments (that) proceeding on the theory and the more elements that are indistinguishable from those produced by gravity.

According to Einstein's gravity, is not a force of  $m_1 m_2 / r^2$ ? It is a distortion in curvature of the space-time (a four-dimensional manifold) of the three dimensions of space plus time that occurs around any massive body. For example, the Sun, it's like a rubber sheet being bent by a weight placed in its center. Even light curves when passing close to a massive body. Thus the position of a star nearer (brighter) if the light passes close to the Sun. This effect was observed in 1919, confirming the theory.
