Power Plants theme is a component of Encyclopedia of Energy Sciences Engineering and Technology Resources in the global Encyclopedia of Life Support Systems EOLSS which is an integrated compendium of twenty Encyclopedias. The Theme on Thermal Power Plants presents three main topics which are then expanded into multiple subtopics each as a chapter. The first topic covers the basic theory including fossil fuel combustion nuclear fission thermal fluids and thermodynamic cycles. It then deals with those aspects important to the maintenance of high efficiency and good reliability such as exergy analysis material characteristics and life extension. The second topic deals with the production of steam. Although this is only the heat receiving part of the steam cycle it is consistent with the general layout of the power plant where the fossil fuel fired boiler or nuclear fission reactor is a separate and distinct part with its own ancillary equipment. Fossil boilers and nuclear reactors both produce steam but are so different that each is covered separately in its respective series of chapters. The third topic deals with the generation of power utilizing the steam produced in the boiler or reactor. Several chapters cover steam turbine design and operation. Since power must be produced to exactly match the demand consideration is given to operational constraints and protective devices. Heat rejection in cooling towers is important where no large body of water exists and is addressed in one chapter. Gas turbines are used for peak power generation and with steam turbines for combined cycle plants so are dealt with in two chapters. Conversion of mechanical power from the turbine to electrical power for distribution to the consumer is an important aspect and is covered by the last chapter. These three volumes are aimed at the following five major target audiences University and College Students Educators Professional Practitioners Research Personnel and Policy Analysts Managers and Decision Makers NGOs and GOs
