Stanley Kubrick's 1968 film 2001 A Space Odyssey famously featured HAL a computer with the ability to hold lengthy conversations with his fellow space travelers. More than forty years later we have advanced computer technology that Kubrick never imagined but we do not have computers that talk and understand speech as HAL did. Is it a failure of our technology that we have not gotten much further than an automated voice that tells us to say or press 1? Or is there something fundamental in human language and speech that we do not yet understand deeply enough to be able to replicate in a computer? In *The Voice in the Machine* Roberto Pieraccini examines six decades of work in science and technology to develop computers that can interact with humans using speech and the industry that has arisen around the quest for these technologies. He shows that although the computers today that understand speech may not have HAL's capacity for conversation they have capabilities that make them usable in many applications today and are on a fast track of improvement and innovation. Pieraccini describes the evolution of speech recognition and speech understanding processes from waveform methods to artificial intelligence approaches to statistical learning and modeling of human speech based on a rigorous mathematical model specifically Hidden Markov Models (HMM). He details the development of dialog systems the ability to produce speech and the process of bringing talking machines to the market. Finally he asks a question that only the future can answer will we end up with HAL like computers or something completely unexpected?

Marsden,2010-01-18 This book is available as open access through the Bloomsbury Open Access programme and is available on [www.bloomsburycollections.com](http://www.bloomsburycollections.com) Chris Marsden maneuvers through the hype articulated by Netwrok Neutrality advocates and opponents He offers a clear headed analysis of the high stakes in this debate about the Internet s future and fearlessly refutes the misinformation and misconceptions that about Professor Rob Freiden Penn State University Net Neutrality is a very heated and contested policy principle regarding access for content providers to the Internet end user and potential discrimination in that access where the end user s ISP or another ISP blocks that access in part or whole The suggestion has been that the problem can be resolved by either introducing greater competition or closely policing conditions for vertically integrated service such as VOIP However that is not the whole story and ISPs as a whole have incentives to discriminate between content for matters such as network management of spam to secure and maintain customer experience at current levels and for economic benefit from new Quality of Service standards This includes offering a priority lane on the network for premium content types such as video and voice service The author considers market developments and policy responses in Europe and the United States draws conclusions and proposes regulatory recommendations
