Building a Cell from its Component Parts, 2015-05-20 The cell interior is another world that we are only beginning to explore Although there are a number of approaches for examining the inner workings of the cell the reductionist approach of building up complexity appeals to many with physical science and engineering backgrounds This volume of Methods in Cell Biology spans a range of spatial scales from single protein molecules to vesicle and cell sized structures capable of complex behaviors Contributions include methods for combining different motors and cytoskeletal components in defined ways to produce more complex behaviors methods to combine cytoskeletal assemblies with fabricated devices such as chambers or pillar arrays reconstituting membrane fission and fusion reconstituting important biological processes that normally take place on membrane surfaces and methods for encapsulating protein machines within vesicles or droplets Covers sections on model systems and functional studies imaging based approaches and emerging studies Chapters are written by experts in the field Cutting edge material *Site-specific Protein Labeling Via Sortase A and Its Applications* Maximilian Wei-Lin Popp, 2011 Technological improvements in the assays and equipment used for biological biochemical biophysical and microscopy purposes have ensured that methods for labeling of proteins with reporter molecules remain in high demand Standard chemical labeling methods using entities that react with amino acid side chains lack the specificity to ensure precise placement of reporter groups Genetic methods although specific lack the versatility afforded by chemical synthesis most reporters are limited to protein sized domains or peptide tags to which corresponding antibody based reagents are available The first portion of this work is devoted to the establishment of a system that allows for the site specific labeling of proteins with a wide variety of chemically synthesized probes This system exploits sortases a class of bacterial transpeptidases that recognize a small five amino acid tag genetically fused to the protein of interest and catalyze the formation of an amide bond between the protein to be studied and the probe The second part of this thesis describes how

this sortase mediated protein labeling method has been implemented to explore enzyme structure and function improve the physical properties of therapeutic proteins study glycoproteins important for innate immune responses in living cells Appendix A and visualize influenza glycoproteins in living infected cells Finally a protocol is included for this system Appendix B which is both versatile and easy to establish in any lab The synthetic chemistry demanded is minimal requiring only standard readily available reagents making the system amenable to labs equipped for cell and molecular biology experiments
