*Statistical Methods in Neuropsychology* David Aaron Maroof, 2012-06-12 This book describes appropriate statistical models that are commonly utilized in neuropsychology. The book discusses such issues as developing normative data for neuropsychological measures, assessing the validity of neuropsychological tests, and quantifying change over time through longitudinal analyses. The rationale for and allure of the volume is the fact that there are no publications that dovetail the two subdisciplines of applied statistics and neuropsychology. The overall objective of this book is to provide a pragmatic and concrete source for applying methodological and statistical techniques in research studies whose emphasis includes neuropsychology. Since there are a plethora of techniques to arrive at similar answers, each method with its strengths and weaknesses will be delineated. The beauty of the book will be that it will hopefully demystify commonly encountered issues faced with researchers. More specifically, it will provide a how to do it approach.

**A Compendium of Neuropsychological Tests** Esther Strauss, Elisabeth M. S. Sherman, Otfried Spreen, 2006-04-06 For the practicing neuropsychologist or researcher, keeping up with the sheer number of newly published or updated tests is a challenge, as is evaluating the utility and psychometric properties of neuropsychological tests in a clinical context. The goal of the third edition of *A Compendium of Neuropsychological Tests*, a well-established neuropsychology reference text, is twofold. First, the Compendium is intended to serve as a guidebook that provides a comprehensive overview of the essential aspects of neuropsychological assessment practice. Second, it is intended as a comprehensive sourcebook of critical reviews of major neuropsychological assessment tools for the use by practicing clinicians and researchers. Written in a comprehensive, easy-to-read reference format and based on exhaustive review of research literature in neuropsychology, neurology, psychology, and related disciplines, the book covers topics such as basic aspects of neuropsychological assessment as well as the theoretical background, norms, and the utility, reliability, and validity of neuropsychological tests. For this third edition, all chapters have been extensively revised and updated. The text has been considerably expanded to provide a comprehensive yet practical overview of the state of the field. Two new chapters have been added: *Psychometrics in Neuropsychological Assessment* and *Norms in Psychological Assessment*. The first two chapters present basic psychometric concepts and principles. Chapters three and four consider practical aspects of the history taking, interview, and the assessment process itself. Chapter five provides guidelines on report writing, and chapters six through sixteen consist of detailed critical reviews of neuropsychological tests and address the topics of intelligence, achievement, executive function, attention, memory, language, visual perception, somatosensory, olfactory function, mood, personality, and response bias. A unique feature is the inclusion of tables that summarize salient features of tests within each domain, so that readers can easily compare measures. Additional tables within each test review summarize important features of each test, highlight aspects of each normative dataset, and provide an overview of psychometric properties. Of interest to neuropsychologists, neurologists, psychiatrists, and educational and clinical psychologists working

with adults as well as pediatric populations this volume will aid practitioners in selecting appropriate testing measures for their patients and will provide them with the knowledge needed to make empirically supported interpretations of test results

**Multivariate Statistical Methods** Donald F. Morrison,2005 MULTIVARIATE STATISTICAL METHODS strikes a crucial balance between the technical information and real world applications of multivariate statistics *Experimental Psychology* R.B. Burns,C.B. Dobson,2012-12-06 This book has been written to meet several needs Firstly there is a need for a book which integrates statistics research design experiments and report writing so that none is learned in a vacuum as commonly is the case isolated from the others The aim is to make the student an active learner encouraged to carry out experiments so experiencing and understanding the design problems and statistical analyses in the practical context where he can see exactly what he is doing and why The aim is that by the end of the book the student should be able to evaluate the research of others to define a problem formulate a hypothesis about it design and carry out the experiment apply the correct statistics discuss the results and implications and write it all up in a logical and sensible fashion The principle is that old pedagogic one of learning by doing Secondly there is a need for an introductory text on statistics research design and experimental work for the many students who meet psychology and social science for the first time The initiate in behavioural science needs to gain a conceptual understanding of statistical procedures and design techniques in order to carry out his own investigations and to understand and evaluate constructively the investigations of others However experience has shown us that many students and even some fellow teachers are somewhat reluctant to study this area as they believe it is difficult and involves mathematics
