Statistical Methods For Speech Recognition Language Speech And Communication:

Statistical Methods for Speech Recognition Frederick Jelinek, 2022-11-01 This book reflects decades of important research on the mathematical foundations of speech recognition. It focuses on underlying statistical techniques such as hidden Markov models, decision trees, the expectation maximization algorithm, information theoretic goodness criteria, maximum entropy probability estimation, parameter and data clustering, and smoothing of probability distributions. The author's goal is to present these principles clearly in the simplest setting to show the advantages of self organization from real data and to enable the reader to apply the techniques.

Bradford Books imprint **The Oxford Handbook of Computational Linguistics** Ruslan Mitkov, 2022-05-23 Ruslan Mitkov's highly successful Oxford Handbook of Computational Linguistics has been substantially revised and expanded in this second edition. Alongside updated accounts of the topics covered in the first edition, it includes 17 new chapters on subjects such as semantic role labelling, text to speech synthesis, translation technology, opinion mining and sentiment analysis, and the application of Natural Language Processing in educational and biomedical contexts among many others. The volume is divided into four parts that examine respectively the linguistic fundamentals of computational linguistics, the methods and resources used such as statistical modelling, machine learning and corpus annotation, key language processing tasks including text segmentation, anaphora resolution and speech recognition, and the major applications of Natural Language Processing from machine translation to author profiling. The book will be an essential reference for researchers and students in computational linguistics and Natural Language Processing as well as those working in related industries.

Thomson,2013-01-08 Speech is the most natural mode of communication and yet attempts to build systems which support robust habitable conversations between a human and a machine have so far had only limited success A key reason is that current systems treat speech input as equivalent to a keyboard or mouse and behaviour is controlled by predefined scripts that try to anticipate what the user will say and act accordingly But speech recognisers make many errors and humans are not predictable the result is systems which are difficult to design and fragile in use Statistical methods for spoken dialogue management takes a radically different view It treats dialogue as the problem of inferring a user's intentions based on what is said The dialogue is modelled as a probabilistic network and the input speech acts are observations that provide evidence for performing Bayesian inference The result is a system which is much more robust to speech recognition errors and for which a dialogue strategy can be learned automatically using reinforcement learning The thesis describes both the architecture the algorithms needed for fast real time inference over very large networks model parameter estimation and policy optimisation This ground breaking work will be of interest both to practitioners in spoken dialogue systems and to cognitive scientists interested in models of human behaviour Encyclopedia of Language & Linguistics E.
