Vinberg A Course In Algebra:

A Course in Algebra Ernest Borisovich Vinberg, 2003-04-10 This is a comprehensive textbook on modern algebra written by an internationally renowned specialist. It covers material traditionally found in advanced undergraduate and basic graduate courses and presents it in a lucid style. The author includes almost no technically difficult proofs and reflecting his point of view on mathematics he tries wherever possible to replace calculations and difficult deductions with conceptual proofs and to associate geometric images to algebraic objects. The effort spent on the part of students in absorbing these ideas will pay off when they turn to solving problems outside of this textbook. Another important feature is the presentation of most topics on several levels allowing students to move smoothly from initial acquaintance with the subject to thorough study and a deeper understanding. Basic topics are included such as algebraic structures, linear algebra, polynomials and groups as well as more advanced topics such as affine and projective spaces, tensor algebra, Galois theory, Lie groups and associative algebras and their representations. Some applications of linear algebra and group theory to physics are discussed. The book is written with extreme care and contains over 200 exercises and 70 figures. It is ideal as a textbook and also suitable for independent study for advanced undergraduates and graduate students. *Principal Structures and Methods of*

Representation Theory Dmitrii Petrovich Zhelobenko, The main topic of this book can be described as the theory of algebraic and topological structures admitting natural representations by operators in vector spaces. These structures include topological algebras, Lie algebras, topological groups and Lie groups. The book is divided into three parts. Part I surveys general facts for beginners including linear algebra and functional analysis. Part II considers associative algebras, Lie algebras, topological groups and Lie groups along with some aspects of ring theory and the theory of algebraic groups. The author provides a detailed account of classical results in related branches of mathematics such as invariant integration and Lie's theory of connections between Lie groups and Lie algebras. Part III discusses semisimple Lie algebras and Lie groups, Banach algebras and quantum groups. This is a useful text for a wide range of specialists including graduate students and researchers working in mathematical physics and specialists interested in modern representation theory. It is suitable for independent study or supplementary reading. Also available from the AMS by this acclaimed author is *Compact Lie Groups and Their Representations*. Calculus and Mechanics on Two-Point Homogenous Riemannian Spaces Alexey V.

Shchepetilov, 2006-09-04 Mathematics develops both due to demands of other sciences and due to its internal logic. The latter fact explains the attention of mathematicians to many problems which are in close connection with basic mathematical notions even if these problems have no direct practical applications. It is well known that the space of constant curvature is one of the basic geometry notion 208 which induced the wide field for investigations. As a result there were found numerous connections of constant curvature spaces with other branches of mathematics for example with integrable partial differential equations 36 153 189 and with integrable Hamiltonian systems 141.
