Abstract Reaching as many students as possible and enabling their success in school is the most important part of education. It has been found that the majority of students learn best when visual and spatial teaching methods are presented in the classroom. In order to reach the majority of students, teachers and parents must understand visual spatial learners and how they are different from primarily auditory sequential learners as well as the best methods for incorporating visual spatial lesson plans into the classroom. Excerpt **Visual-spatial Ability in STEM Education** Myint Swe Khine, 2016-10-13 Each chapter in this book makes a unique contribution to the body of the literature and enhances the understanding of spatial ability and its influence on learning in the STEM disciplines. It addresses spatial abilities, ways to measure them as well as their impact and how they can affect learning subjects in scientific, technology and engineering domains. The volume deliberately covers a wide range of perspectives from cognitive psychology, educational psychology, science, technology, engineering and mathematics, computer science, information technology disciplines to human development. Taking a broad view on the topic, chapters in the book discuss how to define spatial ability and its factors, the measurement of spatial ability and psychometric analyses and educational strategies to improve spatial skills and their implications for science and technology education. The book thus provides an overview of current thinking about visual spatial ability, spatial reasoning and spatial skills. **Serving Visual-Spatial Learners** Steve V. Coxon, 2013 High spatial ability is necessary in many fields, particularly in the visual and performing arts and in science, technology, engineering and math. STEM Serving Visual Spatial Learners seeks to offer teachers, parents and others who work with pre-K to grade 12 students a variety of means by which they can offer a spatially focused education and better address the needs of students with visual spatial ability. The book seeks to answer the question: Can spatial ability be improved in educational settings and if so, how? Education from a Deeper and Multidisciplinary Perspective Chandana Watagodakumbura, PhD, 2016-05-30 Have you ever conjectured deeply on the goals of education in general? What could be the ideal education an individual can receive? Will education only have a focus on an employment or career path or will character or humanistic development that results in a deeper perception of reality be part of it? Do we have a better form of education than what we have currently perceived? In this book, the author attempts to answer the above questions, identifying some of the less obvious limitations of our current pedagogical and social practices. In what he terms as authentic education, the author presents a deeper and multidisciplinary approach to education in which learners are uniquely identified and characterized based on their psychological and neurological traits in order for them to be sent through individualized learning plans spanning the whole life. In an integrated approach to education and human development, individual differences are given special attention and accommodations are made for all-round humanistic development, enhancing creativity and wisdom in day-to-day life operations. Better educated human beings in this way would become better decision makers or problem solvers and more empathic and content personalities. Such an authentic education system has the promise of providing solutions to some of our long-standing social problems. *Creative*

The Influence of Visual-spatial Ability and Study Procedures on Map Learning Skill Cathleen Stasz, Perry W. Thorndyke, 1980 This study investigated the influence of two sources of individual differences in knowledge acquisition from maps abilities and learning procedures Twenty five subjects provided verbal protocols while attempting to learn two maps Visual spatial ability was highly correlated with recall of spatial attributes of the map and with overall learning performance while associative memory ability was most correlated with verbal attribute recall Subject selected procedures for encoding spatial information and assessing learning progress also distinguished the behavior of successful and less successful learners However subjects of high and low ability differed little in the study procedures they chose although both ability differences and procedure use were important contributors to performance a direct comparison of these sources of variation suggested that abilities are most predictive of map learning These observations led us to the following conclusions 1 the use of effective study procedures can influence map learning performance and 2 high ability subjects benefit more from the use of these procedures than low ability subjects Author
