**Theory and Experiences** Valentina Tamma, Stephen Cranefield, Timothy W. Finin, Steven Willmott, 2006-03-30 There is a  
growing interest in the use of ontologies for multi agent system applications On the one hand the agent paradigm is  
successfully employed in those applications where autonomous loosely coupled heterogeneous and distributed systems need  
to interoperate in order to achieve a common goal On the other hand ontologies have established themselves as a powerful  
tool to enable knowledge sharing and a growing number of applications have benefited from the use of ontologies as a means to  
achieve semantic interoperability among heterogeneous distributed systems In principle ontologies and agents are a match  
made in heaven that has failed to happen What makes a simple piece of software an agent is its ability to communicate in a  
social environment to make autonomous decisions and to be proactive on behalf of its user Communication ultimately  
depends on understanding the goals preferences and constraints posed by the user Autonomy is  
the ability to perform a task with little or no user intervention while proactiveness involves acting autonomously with no need for  
user prompting Communication but also autonomy and proactiveness depend on knowledge The ability to communicate  
depends on understanding the syntax terms and structure and the semantics of a language Ontologies provide the terms  
used to describe a domain and the semantics associated with them In addition ontologies are often complemented by some  
logical rules that constrain the meaning assigned to the terms These constraints are represented by inference rules that can  
be used by agents to perform the reasoning on which autonomy and proactiveness are based      **Autocar**, 1997
