

The Digestive System

What is the digestive system?

The digestive system is concerned with the breakdown of food into smaller units, absorption and elimination of waste products. Within the system, the mouth, oesophagus, stomach, small and large intestines, liver, gallbladder and pancreas all work together to digest food. Within these organs, local or feedback controls for the rate of movement of materials through the system are used. The absorption of these materials into the body is an example of the control of the digestive system.

Liver, pancreas & gallbladder

After leaving the stomach, chyme enters the duodenum. The liver, pancreas and gallbladder are situated in the upper right quadrant of the abdomen. The liver produces bile, which is stored in the gallbladder. The pancreas secretes digestive enzymes and hormones. The liver also stores glucose.

Layers of large intestine

Large intestine

The large intestine consists of the cecum, colon, rectum and anal canal. The rectum and anal canal are involved in the storage, removal and elimination of waste products. The remaining waste is stored, absorbed and excreted.

Peristaltic action

Waste material is moved through the digestive system by a series of muscle contractions called peristalsis. The muscle fibres of the muscle layers contract around the outer muscle, causing the muscle to shorten.

The mouth & salivary glands

When we eat, the salivary glands in the mouth produce saliva. Saliva lubricates the food and breaks down starch. Saliva also contains enzymes that break down proteins. The salivary glands are controlled by the nervous system or by the release of hormones. The salivary glands are controlled by the nervous system or by the release of hormones.
