*The Detection of Human Remains* Edward W. Killam, 2004 This work is intended as a guide to the various methods for locating human remains Most of the information is applicable to both archaeological and forensic situations The intended audience is those who become actively involved in the hunt for human bodies such as historic and prehistoric archaeologists and the law enforcement community including coroner or medical examiner investigators and search and rescue teams It contains guidelines for the investigation of missing person or homicide cases which require comprehensive body search planning The core is a guide to methods requiring comprehensive body search planning

**Remote Sensing in Soil Science** M.A. Mulders, 1987-05-01 This book provides comprehensive coverage of remote sensing techniques and their application in soil science A clear step by step approach to the various aspects ensures that the reader will gain a good grasp of the subject so that he can apply the techniques to his own field of study The book opens with a thorough introduction to the physical aspects of electromagnetic radiation and the technical aspects of remote sensing and image processing This is followed by a discussion of the methods for interpreting remote sensing data and their application to soils vegetation and land as a whole As the interpretation of soil conditions is based on many aspects i e soil surface vegetation land use land form the scope of the book is correspondingly broad It will therefore provide much useful information for students and scientists in soil science geography geology hydrology ecology agriculture and civil engineering

*State-of-the-art for Assessing Earthquake Hazards in the United States* Charles E. Glass, David B. Slemmons, 1978 Recent advances in the fields of remote sensing engineering geology seismology and earthquake engineering have developed a need for a systematic comprehensive review of the basic principles and methods of applying remote sensing for evaluation of earthquakes hazards and seismic risk This paper responds to this need by reviewing basic concepts summarizing essential state of the art knowledge of theory and instrumental methods establishing procedures evaluations and discussing representative case histories that illustrate earthquake hazard evaluations that are based on remote sensing analysis The approach that is recommended is based on a multi approach that uses an integrated and systematic study of a region or a fault with a variety of imagery varying from small scale synoptic to large scale detailed The imagery analysis should be followed by a ground verification program of study that should include both ground and aerial reconnaissance examination of the major geologic structures of concern The character of the earthquake hazards is discussed in the context of the lithologic structural vegetational and topographic variations that are associated with different types of active geologic structures The response of earth materials landforms and geologic structures is summarized for the several main types of passive and active electromagnetic radiation used in current remote sensing practice Limitations of the different spectral regions used in remote sensing are reviewed to assist in the selection of ideal methods or sequences of methods of study for effective evaluation of active or capable faults and for assessing the earthquake potential of geological structures that may affect a given engineering site
