Systole vs Diastole

Systole corresponds to the heart's contraction, while **Diastole** represents its relaxation.

Anatomy of Heart

A cone-shaped organ situated in the mediastinal space is safeguarded and cushioned by the pericardial sac.

This sac encloses the heart, provides lubrication, and contains approximately 5-20 mL of pericardial fluid.

Comprising two layers:

- Pericardial sac consists of the outer membrane called the **parietal pericardium**
- Inner membrane known as the **visceral pericardium**, which is directly attached to the heart.

Cardiac Layers

- **Epicardium**: the outermost layer of the heart
- **Myocardium**: the middle layer of the heart, the contracting muscle of the heart
- **Endocardium**: the innermost layer of the heart, lines the inner chambers, and the valves

Cardiac Valves

Two atrioventricular valves close to impede the backward flow of blood into the atria during ventricular contraction. These valves prevent the regurgitation of blood.

- **Tricuspid**: on the right side of the heart
- **Bicuspid/Mitral**: on the left side of the heart

Two semilunar valves close to impede the backward flow of blood into the ventricles during relaxation.

- **Pulmonic**: between the right ventricle and pulmonary artery
- **Aortic**: between the left ventricle and aorta

Systole: the heart pumps blood into the arteries as the atrioventricular valves close, resulting in the characteristic "lub" sound.

Diastole: heart chambers fill with blood as blood flows into the heart, and the semilunar valves cause the distinctive "dub" sound.
