

ANSWERS : Digestive System Study Guide

Learning Standard 1.2c

The digestive system consists of organs that are responsible for the mechanical and chemical breakdown of food. The breakdown process results in molecules that can be absorbed and transported to cells.

Complete the chart by identifying the function of the main organs of the digestive system.

digestive organ	function
1. mouth	1. <i>Mechanical and chemical digestion begins in the mouth. The teeth mechanically break the food into smaller pieces as saliva's enzymes speed up chemical reactions.</i>
2. esophagus	2. <i>The esophagus moves the chewed food downward toward the stomach. Muscle movements known as "peristalsis" help it to easily move along.</i>
3. stomach	3. <i>The stomach uses both mechanical and chemical digestion to further break the food into nutrient molecules. It churns the food and adds a strong acid and the enzyme pepsin to digest the proteins in the food.</i>
4. liver	4. <i>The liver produces bile, which is used to break fat into smaller pieces. The bile is stored in the gall bladder until it is needed by the small intestine.</i>
5. small intestine	5. <i>Most of the chemical digestion of food takes place in the small intestine. Bile is squirted from the gall bladder into the small intestine to break up fat particles. Enzymes from the pancreas continue to break down starches, proteins, and fats.</i> <i>Will absorb the nutrient molecules into the blood stream for quick delivery to the body's cells.</i>
6. large intestine	6. <i>The large intestine absorbs the remaining water. Bacteria work on indigestible materials and make vitamins. Waste is prepared for removal and sent to the rectum.</i>
