

Big Picture

Protists belong to the protist kingdom under domain Eukarya. Protists are some of the most basic eukaryotes and are believed to be the ancestors of modern day animals, plants, and fungi. Many protists inhabit aquatic environments or moist terrestrial ones. Protists reproduce using a combination of asexual and sexual reproduction, having complex life cycles. The three main classifications of protists are: protozoa, algae, and molds.

Key Terms

Endosymbiotic Theory: Theory that eukaryotic organelles such as mitochondria evolved from ancient, free-living prokaryotes that invaded primitive eukaryotic cells.

Motility: The ability to move.

Pseudopod: A temporary protrusion from the cell membrane.

Flagella: Whip-like projections.

Cilia: Short, whip-like projections.

Protozoa: Animal-like protist.

Algae: Plant-like protist.

Mold: Fungus-like protist.

General Characteristics

Protists, believed to be the oldest eukaryotic organisms, may have evolved by endosymbiosis. The **endosymbiotic theory** postulates that a smaller prokaryotic cell, such as a photosynthetic one, was engulfed by a larger one, forming a symbiotic relationship from which both cells benefited.

- Eventually, the smaller prokaryotic cell(s) became the organelles, such as the mitochondria and the chloroplast, of the larger cell.
- Evidence for this theory includes independent mitochondrial and chloroplast DNA, and the plasma membrane surrounding the two organelles resembles that of prokaryotes.

Motility

Protists have various appendages that give them **motility**, the ability to move. They include cilia, pseudopodia, and flagella.

- Pseudopods** look like feet walking. The extension and retraction of pseudopods help move the cell forward.
- Flagella** are typically significantly longer than cilia. Protists may possess one or more flagellum.
- The swaying of **cilia** determines the direction of movement of the protist.

Reproduction

Protists can reproduce both asexually or sexually.

- Asexual reproduction: binary fission
- Sexual reproduction: produce reproductive cells called spores that can fuse together to form a diploid zygote

Nutrition

- Ingestive protists:** These protists eat by endocytosis. They surround their food particle and then engulf it, forming a food vacuole. Enzymes within the cell digest the food.

Ingestive protists take food inside.

- Absorptive protists:** In these protists, food particles simply diffuse across the plasma membrane.

Absorptive protists absorb food.

- Photosynthetic protists:** These protists undergo photosynthesis, harnessing light energy to convert inorganic molecules into sugar.

Figure: Flagellum and cilia movement.
