Combinatorics and Reasoning Carolyn A. Maher, Arthur B. Powell, Elizabeth B. Uptegrove, 2010-11-25 Combinatorics and Reasoning Representing Justifying and Building Isomorphisms is based on the accomplishments of a cohort group of learners from first grade through high school and beyond concentrating on their work on a set of combinatorics tasks. By studying these students the editors gain insight into the foundations of proof building the tools and environments necessary to make connections activities to extend and generalize combinatoric learning and even explore implications of this learning on the undergraduate level. This volume underscores the power of attending to basic ideas in building arguments it shows the importance of providing opportunities for the co construction of knowledge by groups of learners and it demonstrates the value of careful construction of appropriate tasks. Moreover it documents how reasoning that takes the form of proof evolves with young children and discusses the conditions for supporting student reasoning

Theorems in School, 2007-01-01 During the last decade a revaluation of proof and proving within mathematics curricula was recommended great emphasis was put on the need of developing proof related skills since the beginning of primary school. This book addressing mathematics educators, teacher trainers and teachers is published as a contribution to the endeavour of renewing the teaching of proof and theorems on the basis of historical epistemological cognitive and didactical considerations. Authors come from eight countries and different research traditions this fact offers a broad scientific and cultural perspective. In this book the historical and epistemological dimensions are dealt with by authors who look at specific research results in the history and epistemology of mathematics with an eye to crucial issues related to educational choices. Two papers deal with the relationships between curriculum choices concerning proof and the related implicit or explicit epistemological assumptions and historical traditions in two different school systems and the teaching and learning of proof there. The cognitive dimension is important in order to avoid that the didactical choices do not fit the needs and the potentialities of learners. Our choice was to firstly deal with the features of reasoning related to proof mainly concerning the relationships between argumentation and proof. The second part of this book concentrates on some crucial cognitive and didactical aspects of the development of proof from the early approach in primary school to high school and university. We will show how suitable didactical proposals within appropriate educational contexts can match the great yet underestimated young students potentialities in approaching theorems and theories
