Nonlinear Circuits and Systems with Memristors Fernando Corinto, Mauro Forti, Leon O. Chua, 2020-10-31 This book presents a new approach to the study of physical nonlinear circuits and advanced computing architectures with memristor devices. Such a unified approach to memristor theory has never been systematically presented in book form. After giving an introduction on memristor based nonlinear dynamical circuits e.g. periodic chaotic oscillators and their use as basic computing analogue elements the authors delve into the nonlinear dynamical properties of circuits and systems with memristors and present the flux charge analysis a novel method for analyzing the nonlinear dynamics starting from writing Kirchhoff laws and constitutive relations of memristor circuit elements in the flux charge domain. This analysis method reveals new peculiar and intriguing nonlinear phenomena in memristor circuits such as the coexistence of different nonlinear dynamical behaviors extreme multistability and bifurcations without parameters. The book also describes how arrays of memristor based nonlinear oscillators and locally coupled neural networks can be applied in the field of analog computing architectures for example for pattern recognition. The book will be of interest to scientists and engineers involved in the conceptual design of physical memristor devices and systems mathematical and circuit models of physical processes circuits and networks design system engineering or data processing and system analysis **Nonlinear Systems** Khalil, 1996

Differential Equations: Methods and Applications Belkacem Said-Houari, 2016-01-11 This book presents a variety of techniques for solving ordinary differential equations analytically and features a wealth of examples. Focusing on the modeling of real world phenomena it begins with a basic introduction to differential equations followed by linear and nonlinear first order equations and a detailed treatment of the second order linear equations. After presenting solution methods for the Laplace transform and power series it lastly presents systems of equations and offers an introduction to the stability theory. To help readers practice the theory covered two types of exercises are provided those that illustrate the general theory and others designed to expand on the text material. Detailed solutions to all the exercises are included. The book is excellently suited for use as a textbook for an undergraduate class of all disciplines in ordinary differential equations.

[Control Theory and Advanced Technology](#) , 1995 [Recent Stability Issues for Linear Dynamical Systems](#) Nicola Guglielmi, Christian Lubich, Nicolas Gillis, Volker Mehrmann, Punit Sharma, Bart Vandereycken, 2024-12-13 This book concerns matrix nearness problems in the framework of spectral optimization. It addresses some current research directions in spectral based stability studies for differential equations with material on ordinary differential equations ODEs differential algebraic equations and dynamical systems. Here stability is interpreted in a broad sense which covers the need to develop stable and reliable algorithms preserving some qualitative properties of the computed solutions methodologies which are helpful to assess the onset of potential instabilities or loss of robustness and tools to determine the asymptotic properties of the solution or its discretization. The topics considered include the computation of robustness measures for linear problems the

use of low rank ODEs to approximate such measures via gradient systems the regularity stability passivity and controllability analysis of structured linear descriptor systems and the use of acceleration techniques to deal with some of the presented computational problems Although the emphasis is on the numerical study of differential equations and dynamical systems the book will also be of interest to researchers in matrix theory spectral optimization and spectral graph theory as well as in dynamical systems and systems theory [Reliable Implementation of Real Number Algorithms: Theory and Practice](#) Peter Hertling, Christoph M. Hoffmann, Wolfram Luther, Nathalie Revol, 2008-08-06 A large amount of the capacity of today's computers is used for computations that can be described as computations involving real numbers In this book the focus is on a problem arising particularly in real number computations the problem of verified or reliable computations Since real numbers are objects containing an infinite amount of information they cannot be represented precisely on a computer This leads to the well known problems caused by unverified implementations of real number algorithms using finite precision While this is traditionally seen to be a problem in numerical mathematics there are also several scientific communities in computer science that are dealing with this problem This book is a follow up of the Dagstuhl Seminar 06021 on Reliable Implementation of Real Number Algorithms Theory and Practice which took place January 8-13 2006 It was intended to stimulate an exchange of ideas between the different communities that deal with the problem of reliable implementation of real number algorithms either from a theoretical or from a practical point of view Forty eight researchers from many different countries and many different disciplines gathered in the castle of Dagstuhl to exchange views and ideas in a relaxed atmosphere The program consisted of 35 talks of 30 minutes each and of three evening sessions with additional presentations and discussions There were also lively discussions about different theoretical models and practical approaches for reliable real number computations
