Projective Simulation in Action Hans J. Briegel,Thomas Müller,2025-09-26 This open access monograph presents an in depth study of the problem of how agency fits into the physical world In particular the authors focus on agency as a precondition of free will They present a detailed and physically well motivated formal model to anchor their philosophical discussion Coverage brings together perspectives from physics computer science and different branches of philosophy The book describes the agency model of Projective Simulation its physical realisability and its quantum extensions It situates this model within the discussion of agency in philosophy and in Artificial Intelligence In addition the authors highlight the role of agency in Quantum Mechanics itself recently stressed by the Bayesian inspired interpretation of Quantum Mechanics QBism They provide a comprehensive exposition of Quantum Mechanics and a reflection on the embodied nature of agents Quantum indeterminism turns out to be a key resource for Projective Simulation and for agency in general This establishes a novel connection between agency and phenomenology Overall the book provides a coherent picture of agents as persisting physical entities endowed with active capacities Such an explanation does not necessarily settle the question of the actual empirical basis of our human agency It does however show that a coherent notion of agency is possible within a modern scientific world view

issues [Investigating Complex Phenomena: Bridging between Systems Thinking and Modeling in Science Education](#) Tom Bielik, Moritz Krell, Laura Zangori, Orit Ben Zvi Assaraf, 2023-11-15 Understanding the complexity of the natural world and making sense of phenomena is one of the main goals of science and science education. When investigating complex phenomena such as climate change or pandemic outbreaks students are expected to engage in systems thinking by considering the boundaries of the investigated system identifying the relevant components and their interactions and exploring system attributes such as hierarchical organization, dynamicity, feedback loops and emergence. Scientific models are tools that support students' reasoning and understanding of complex systems and students are expected to develop their modeling competence and to engage in the modeling process by constructing, testing, revising and using models to explain and predict phenomena. Computational modeling tools for example provide students with the opportunity to explore big data, run simulations and investigate complex systems. Therefore both systems thinking and modeling approaches are important for science education when investigating complex phenomena. **Online**, 1983 [Scholastic Administr@tor](#), 2005-03
