said information and realization of useful healthcare devices are lagging behind In order to remedy this discrepancy more interdisciplinary research works and course curricula need to be introduced in academic industrial and clinical organizations alike To that end this book reformulates most of the existing mathematical models as special cases of a general model allowing readers to easily get an overall idea of cancer dynamics and its modeling Moreover the book will help bridge the gap between biologists and engineers as it brings together cancer dynamics the main steps involved in mathematical modeling and control strategies developed for cancer management This also allows readers in both medical and engineering fields to compare and contrast all the therapy based models developed to date using a single source and to identify unexplored research directions
