

# Structure and Interpretation of Computer Programs

## Why?

SiCp has been a great classic of computer science for more than two decades, and is likely to remain so for many more. Its reputation has grown throughout the 90s, and continued to do so (posthumously): the SICP course (which SiCp served as the textbook of) is now a Python-oriented course to accommodate shifting computing trends. SiCp's broad strokes remain as vibrant as the day it was written however. The real soul of this book is in its exercises: a powerful graphics language, a computer algebra system, a Scheme and JIT evaluator, a Prolog-like language and more. This expansive coverage of so many topics of computing spawned a long tradition of hackers studying it and writing solutions to its exercises.

An exhaustive reading of the book was unlikely for its target audience. SiCp contains statements and source code that are redundant or ambiguous. Asking readers to consider code and structures whose details are described in principle, only later introducing their implementation. This pedagogical approach is maybe more sensible in the lecture hall, but is inefficient for the enthusiast.

SiCp makes it your responsibility to learn what the book has to teach, and part of that duty is ensuring you'll actually finish it by eliminating the details like dedging its contents to clarify a remark or reading in hindsight that a few minutes when starting a chapter could've saved hours down the road.

If you get absolutely stuck, this repository also contains unique solutions to almost all of the exercises in Guile & PLT Scheme.

If you are interested in exploit writing, assembly or reverse engineering "proper" you can also check out my ["Practical Reverse Engineering of x86 and the Windows Kernel"](#) study guide and solutions as well.

## How To Do It

### Getting It

Although the original is [available online](#), I'd recommend your trip down to the textinfo basins or gear up to a fully-featured experience on the web.

- [Sara Bander's SiCp \(Web\)](#)
- [My Own Instructions \( Emacs/ Textinfo \)](#)

### Environment

An important first step to having fun with SiCp is to have a pain free environment and REPL. I personally couldn't imagine doing it with anything except Emacs. [If you are a vim user, you can be at home in Emacs too.](#)

With that said, the Racket community has put together something truly astonishing with [DrRacket](#). I have used its excellent debugger over and over (when you want true enlightenment, debug chapter 2's `partial-tree`) and could imagine it as a great SiCp environment, perhaps even surpassing Emacs in this regard.

### Language

SiCp avoids implementation-dependant behavior and often won't show the results of functions whose behavior differs between implementations. Still, SiCp has often been done with [MIT Scheme](#) while many have used other Schemes, Ligo, and languages pretending to be both. I've seen some of the following used and have tried to approximate their fitness for the task with some features I've found useful:

- Object systems: are tremendously useful in chapter 3 particularly.
- Function "redefinition" is extremely useful and practically required if you want to write your code iteratively.
- A few subchapters of Chapter 3 require a "read" concurrency system in order to tell if you are doing the right things.
- Several chapters (more-on-lect) require mutable lists. Languages like Racket do have mutable lists but use different method names, and so will require you rewrite some code from the book.
- Some chapters, such as those pertaining to the evaluator, are made much easier with the introduction of `let` to `let-syntax`.

Language	Easy	Unit Tests	Native OOP	Function Redefinition	let!	Notes
Guile	5/5	✓	✓	✓	✓	Fully featured Ligo used by many programs, like OOB as an extension language.
