### What you do

1. Wrap a lid around the outside of one of the glasses.
2. Fill a jar with warm water and wrap the lid around it to cover the top edge.
3. Gently fill the jar with water and the water temperature will increase when the lid is wrapped around them.
4. Fill a jar with cold water in the bottom of the lid wrapped jar and then place it under the larger jar that has the big jar supporting the lid on top.
5. Leave the jar for about 15 minutes and then measure the water temperature using the thermometer.
6. Compare the temperature difference between the wrapped and unwrapped jars.

### Explanation

The lid on the jar stopped water from evaporating and taking heat away in the process. This is why between the big jar and the lid wrapped jar, evaporation from the water was less and the water temperature did not change.

The glass of water did not stop heat loss from the bottom of the jar.

The glass of water is being heated less than the jar.
