### Chapter (11): Static Electricity

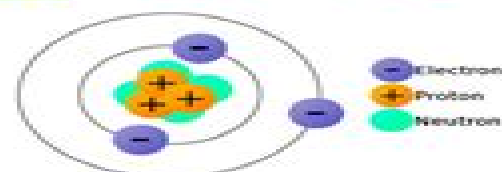

#### 11.2: Electric Charge:

- Like Charges repel.
- Unlike Charges attract.
- The force decreases as distance between charges increases.

Everything is made of tiny particles called atoms. These have electric charge inside them. A simple model of the atom is shown on the right. There is a central nucleus made of Protons and Neutrons. And orbiting the nucleus there are much lighter particles called Electrons:

- Electrons have a negative charge (-).
- Protons have an equal positive charge (+).
- Neutrons carry no charge and are said to be "neutral".

- A positively charged object is an object that has lost electrons.
- A negatively charged object is an object that has gained extra electrons.

**Note:** only electrons (negative charges) are able to move because protons are held in place at the nucleus.

#### 11.3: Conductors and Insulators:

**Conductors** are materials that let electrons pass through them. **Metals** are the best electrical conductors. This is because some of the electrons are loosely held to their atoms and are called "free electrons".

**Insulators** are materials that hardly conduct at all. Their electrons are held tightly to atoms and are not free to move - although they can be transferred by rubbing. (eg: wood, plastic and air)

#### 11.4: Methods of Charging a Body:

##### 11.4.1 Charging by rubbing (friction charging):
