Statistical Mechanics Of Driven Diffusive Systems Volume 17:

Phase Transitions and Critical Phenomena ,2000-09-15 The field of phase transitions and critical phenomena continues to be active in research producing a steady stream of interesting and fruitful results No longer an area of specialist interest it has acquired a central focus in condensed matter studies The major aim of this serial is to provide review articles that can serve as standard references for research workers in the field and for graduate students and others wishing to obtain reliable information on important recent developments The two review articles in this volume complement each other in a remarkable way Both deal with what might be called the modern geometric approach to the properties of macroscopic systems The first article by Georgii et al describes how recent advances in the application of geometric ideas leads to a better understanding of pure phases and phase transitions in equilibrium systems The second article by Alava et al deals with geometrical aspects of multi body systems in a hands on way going beyond abstract theory to obtain practical answers The combination of computers and geometrical ideas described in this volume will doubtless play a major role in the development of statistical mechanics in the twenty first century *Computer Simulation Studies in Condensed-Matter Physics XVIII* David P. Landau, Steven P. Lewis, Heinz-Bernd Schüttler, 2007-08-02 Almost two decades ago because of the tremendous increase in the power and utility of computer simulations The University of Georgia formed the first institutional unit devoted to the use of simulations in research and teaching The Center for Simulation Physics As the international simulations community expanded further we sensed a need for a meeting place for both experienced simulators and neophytes to discuss new techniques and recent results in an environment which promoted lively discussion As a consequence the Center for Simulation Physics established an annual workshop on Recent Developments in Computer Simulation Studies in Condensed Matter Physics This year's workshop was the eighteenth in this series and the continued interest shown by the scientific community demonstrates quite clearly the useful purpose that these meetings have served The latest workshop was held at The University of Georgia March 7-11 2005 and these proceedings provide a status report on a number of important topics This volume is published with the goal of timely dissemination of the material to a wider audience We wish to offer a special thanks to IBM for partial support of this year's workshop This volume contains both invited papers and contributed presentations on problems in both classical and quantum condensed matter physics We hope that each reader will benefit from specialized results as well as profit from exposure to new algorithms methods of analysis and conceptual developments Athens GA USA D P Landau October 2005 S P Lewis H B *Index* ,2000-10-06 The field of phase transitions and critical phenomena continues to be active in research producing a steady stream of interesting and fruitful results It has moved into a central place in condensed matter studies Statistical physics and more specifically the theory of transitions between states of matter more or less defines what we know about everyday matter and its transformations The major aim of this serial is to provide review articles that can serve as standard references for research workers in the field

and for graduate students and others wishing to obtain reliable information on important recent developments

Non-Equilibrium Phase Transitions Malte Henkel,Haye Hinrichsen,Sven Lübeck,2008-11-27 This book describes two main classes of non equilibrium phase transitions static and dynamics of transitions into an absorbing state and dynamical scaling in far from equilibrium relaxation behavior and ageing

50 Years Of The Renormalization Group: Dedicated To The Memory Of Michael E Fisher Amnon Aharony,Ora Entin-wohlman,David A Huse,Leo Radzihovsky,2024-07-26 The contributions in the book are devoted to the memory of Michael E Fisher and hence include many personal memories from people whose work was influenced by him Also the book is a collection of articles from leaders in the field of phase transitions and critical phenomena to celebrate 50 years of the renormalization group and the 1972 paper by Wilson and Fisher Many of the articles review in tutorial form the progress in the fields of phase transitions and the renormalization group

Critical Dynamics Uwe C. Täuber,2014-03-06 Introducing a unified framework for describing and understanding complex interacting systems common in physics chemistry biology ecology and the social sciences this comprehensive overview of dynamic critical phenomena covers the description of systems at thermal equilibrium quantum systems and non equilibrium systems Powerful mathematical techniques for dealing with complex dynamic systems are carefully introduced including field theoretic tools and the perturbative dynamical renormalization group approach rapidly building up a mathematical toolbox of relevant skills Heuristic and qualitative arguments outlining the essential theory behind each type of system are introduced at the start of each chapter alongside real world numerical and experimental data firmly linking new mathematical techniques to their practical applications Each chapter is supported by carefully tailored problems for solution and comprehensive suggestions for further reading making this an excellent introduction to critical dynamics for graduate students and researchers across many disciplines within physical and life sciences

Scale Invariance, Interfaces, and Non-Equilibrium Dynamics Alan McKane,Michel Droz,Jean Vannimenus,Dietrich Wolf,2013-06-29 The NATO Advanced Study Institute on Scale Invariance Interfaces and Non Equilibrium Dynamics was held at the Isaac Newton Institute for Mathematical Sciences in Cambridge UK from 20 30 June 1994 The topics discussed at the Institute were all concerned with the origin and nature of complex structures found far from equilibrium Examples ranged from reaction diffusion systems and hydrodynamics through to surface growth due to deposition A common theme was that of scale invariance due to the self similarity of the underlying structures The topics that were covered can be broadly classified as pattern formation theoretical computational and experimental aspects the non equilibrium dynamics of the growth of

interfaces and other manifolds coarsening phenomena generic scale invariance in driven systems and the concept of self organized criticality The main feature of the Institute was the four one hour long lectures given each day by invited speakers In addition to thirty seven of these lectures two contributed lectures were also given The many questions that were asked after the lectures attested to the excitement and interest that the lecturers succeeded in generating amongst the students In addition to the discussions initiated by lectures an important component of the meeting were the poster sessions where participants were able to present their own work which took place on three of the afternoons The list of titles given at the end of these proceedings gives some idea of the range and scope of these posters *Statphys 22* Sushanta Dattagupta, 2005
