

How does Value at Risk (VaR) work

Line at -0.82 means 5%
Value-at-Risk is 0.82.

Red area to the left of the line represents 5% of the total area under the curve.

The curve represents a hypothetical Profit-and-Loss probability density function. It has mean one & standard deviation one, but fatter tails than a Normal distribution. The 5% VaR point is 1.82 standard deviations below the mean, versus 1.64 for a Normal distribution.

Green area to the right of the line represents 95% of the total area under the curve.

What are the chances and limitations of value-at-risk (VaR) models? Alexander Linn, Dennis Röhrig, 2006-05-21 Seminar paper from the year 2004 in the subject Business economics Controlling grade 1 7 European Business School International University Schlo Reichartshausen Oestrich Winkel Department of Accounting and Control language English abstract The risk and return framework is generally accepted and discussed by scientists at least since Markowitz introduced his Portfolio Theory in 1952 Subsequently models were developed to evaluate investments under consideration of risk and return Traditionally practitioners primarily focused on past earnings as a measure of the profitability of an investment without adequately considering potential risks Therefore the development of professional risk management systems was often neglected Thus the possibility of high losses was not appropriately incorporated in their investment strategies The consequences of such mistreatment became evident in the mid 1990s when some of the world's largest companies faced huge losses and sometimes even insolvency Most of these failures were a direct result of inappropriate use of financial instruments and insufficient internal control mechanisms The most spectacular debacles even resulted in losses of more than one billion dollars for each affected institution In case of Barings Bank a single trader ruined the 233 year old British financial institution by inappropriate investments in high risk futures in 1995 The consequent loss of 1.3 billion realized in a very short period could not be absorbed and forced the downfall of Barings At Daiwa Bank it was also a single trader who caused a 1.1 billion deficit In contrast the losses were accumulated over 11 years from 1984 Another well publicized bankruptcy was declared in 1994 by the Californian Orange County after losses of 1.8 billion Such evidence of poor risk management and control shows that proper financial risk management is crucial for all kinds of institutions in order to guarantee stability and continuity Therefore it is necessary to establish adequate risk management processes and to develop appropriate tools which quantify risk exposures of both entire institutions and single financial instruments This risk quantification should alert management early enough to prevent exceptional losses One of the key concepts addressing these problems of modern risk management was introduced in 1993 with the Value at Risk VaR models

Report on Analysis of the 260-Day Value at Risk (VAR) of Portfolio of Shares Calvin Monroe, 2014-02-28 Scientific Essay from the year 2012 in the subject Business economics Investment and Finance grade B King's College London language English abstract For quite a long time now the main concern for investors as well as regulators of financial markets has been the risk of catastrophic market and the sufficiency of capital needed to counter such kind of risk when it occurs Many institutions have undergone losses despite their gigantic nature and good forecasting and this has been associated with inappropriate forms of pricing and poor management together with the fraudulent cases factors that have always brought the issue of managing risk and regulating these financial markets to the level of public policy as well as discussion A basic tool that has been identified as being effective in the assessment of financial risk is the Value at Risk VaR process Artzner et al 1997 The VaR has been figured out as being an amount that is lost on a given form of portfolio

including a small probability in a certain fixed period of time counted in terms of days VaR however poses a major challenge during its implementation and this has more to do with the specification of the kind of probability distribution having extreme returns that is made use of during the calculation of the estimates used in the VaR analysis Mahoney 1996 McNeil Dowd 2001 As has been noted the nature of VaR estimation majorly does depend on the accurate predictions of some uncommon events or risks that are catastrophic This is attributed to the fact that VaR is a calculation made from the lowest portfolio returns For this reason any form of calculation that is employed in the estimation of VaR must be able to encompass the tail events prediction and make this its primary goal Chiang et al 2007 Engle 2002 Engle Francis et al 2001 There have been statistical techniques as well as thumb rules that many researchers argue as having been very instrumental in the prediction and analysis of intra day and in most cases day to day risk These are however not appropriate for the analysis of VaR The predictions of VaR now fall under parametric predictions that encompass conditional volatilities and non parametric prediction that incorporate the unconditional volatilities Jorion 2006 Jorion 2007

correlation are also introduced as necessary background for students and practitioners. This is essential reading for all those who require an introduction to financial market risk management and risk measurement techniques. Foreword by Carol Alexander Professor of Finance University of Sussex Measuring Market Risk with Value at Risk Pietro Penza, Vipul K. Bansal, 2001. This book *Measuring Market Risk with Value at Risk* by Vipul Bansal and Pietro Penza has three advantages over earlier works on the subject. First it takes a decidedly global approach an essential ingredient for any comprehensive work on market risk. Second it ties the scientifically grounded yet intuitively appealing VaR measure to earlier more idiosyncratic measures of market risk that are used in specific market environs e.g. duration in fixed income. Finally it encompasses all of the accepted approaches to calculating a VaR measure and presents them in a clearly explained fashion with supporting illustrations and completely worked out examples from the Foreword by John F Marshall PhD Principal Marshall Tucker Associates LLC. *Measuring Market Risk with Value at Risk* offers a much needed intellectual bridge a translation from the esoteric realm of mathematical finance to the domain of financial managers who seek guidance in applying developments from this important field of research as well as that of MBA level graduate instruction. I believe the authors have done a commendable job of providing a carefully crafted highly readable and most useful work and intend to recommend it to all those involved in business risk management applications. Anthony F Herbst PhD Professor of Finance and C R and D S Carter Chair The University of Texas El Paso and Founding editor of *The Journal of Financial Engineering* 1991-1998. Finally there's a book that strikes a balance between rigor and application in the area of risk management in the banking industry. This innovative book is a MUST for both novices and professionals alike. Robert P Yuyuenyongwatana PhD Associate Professor of Finance Cameron University. *Measuring Market Risk with Value at Risk* is one of the most complete discussions of this emerging topic in finance that I have seen. The authors develop a logical and rigorous framework for using VaR models providing both historical references and analytical applications. Extreme Value Theory and Value at Risk Viviana Fernandez,2008 Value at Risk VaR is a measure of the maximum potential change in value of a portfolio of financial assets with a given probability over a given time horizon VaR became a key measure of market risk since the Basle Committee stated that banks should be able to cover losses on their trading portfolios over a ten day horizon 99 percent of the time A common practice is to compute VaR by assuming that changes in value of the portfolio are normally distributed conditional on past information However assets returns usually come from fat tailed distributions Therefore computing VaR under the assumption of conditional normality can be an important source of error We illustrate this point with Chilean and U S returns series by resorting to extreme value theory EVT and GARCH type models In addition we show that dynamic estimation of empirical quantiles can also give more accurate VaR estimates than quantiles of a standard normal
