Wave Propagation in Linear and Nonlinear Periodic Media Francesco Romeo, Massimo Ruzzene, 2013-07-30 Waves and defect modes in structures media Piezoelectric superlattices and shunted periodic arrays as tunable periodic structures and metamaterials Topology optimization Map based approaches for periodic structures Methodologies for nonlinear periodic media The contributions in this volume present both the theoretical background and an overview of the state of the art in wave propagation in linear and nonlinear periodic media in a consistent format They combine the material issued from a variety of engineering applications spanning a wide range of length scale characterized by structures and materials both man made and naturally occurring featuring geometry micro structural and or materials properties that vary periodically in space including periodically stiffened plates shells and beam like as well as bladed disc assemblies phononic metamaterials photonic crystals and ordered granular media Along with linear models and applications analytical methodologies for analyzing and exploiting complex dynamical phenomena arising in nonlinear periodic systems are also presented      Elastic Wave Propagation in Periodic Structures Through Numerical and Analytical Homogenization Techniques Xiangkun Sun, 2016 In this work the multi scale homogenization method as well as various non homogenization methods will be presented to study the dynamic behaviour of periodic structures The multi scale method starts with the scale separation which indicates a micro scale to describe the local behaviour and a macro scale to describe the global behaviour According to the homogenization theory the long wave assumption is used and the unit cell length should be much smaller than the characteristic length of the structure Thus the valid frequency range of homogenization is limited to the first propagating zone The traditional homogenization model makes use of material properties mean values but the practical validity range is far less than the first Bragg band gap This deficiency motivated the development of new enriched homogenized models

Compared to traditional homogenization model higher order homogenized wave equations are proposed to provide more accuracy homogenized models Two multi scale methods are introduced the asymptotic expansion method and the homogenization of periodic discrete media method HPDM These methods will be applied sequentially in longitudinal wave cases in bi periodic rods and flexural wave cases in bi periodic beams Same higher order models are obtained by the two methods in both cases Then the proposed models are validated by investigating the dispersion relation and the frequency response function Analytical solutions and wave finite element method WFEM are used as references Parametric studies are carried out in the infinite case while two different boundary conditions are considered in the finite case Afterwards the HPDM and the CWFEM are employed to study the longitudinal and transverse vibrations of framed structures in 1D case and 2D case The valid frequency range of the HPDM is re evaluated using the wave propagation feature identified by the CWFEM The relative error of the wavenumber by HPDM compared to CWFEM is illustrated in the function of frequency and scale ratio Parametric studies on the thickness of the structure is carried out through the dispersion relation The dynamics of finite structures are also investigated using the HPDM and CWFEM
