## **Variational Methods For Engineers With Matlab:**

*Variational Methods for Engineers with Matlab* Eduardo Souza de Cursi, 2015-10-02 This book is issued from a 30 years experience on the presentation of variational methods to successive generations of students and researchers in Engineering. It gives a comprehensive pedagogical and engineer oriented presentation of the foundations of variational methods and of their use in numerical problems of Engineering. Particular applications to linear and nonlinear systems of equations, differential equations, optimization and control are presented. MATLAB programs illustrate the implementation and make the book suitable as a textbook and for self study. The evolution of knowledge of the engineering studies and of the society in general has led to a change of focus from students and researchers. New generations of students and researchers do not have the same relations to mathematics as the previous ones. In the particular case of variational methods, the presentations used in the past are not adapted to the previous knowledge, the language and the centers of interest of the new generations. Since these methods remain a core knowledge, thus essential in many fields: Physics, Engineering, Applied Mathematics, Economics, Image analysis, a new presentation is necessary in order to address variational methods to the actual context.

*Computational Intelligence in Emerging Technologies for Engineering Applications* Orestes Llanes Santiago, Carlos Cruz Corona, Antônio José Silva Neto, José Luis Verdegay, 2020-02-14 This book explores applications of computational intelligence in key and emerging fields of engineering, especially with regard to condition monitoring and fault diagnosis, inverse problems, decision support systems and optimization. These applications can be beneficial in a broad range of contexts including water distribution networks, manufacturing systems, production and storage of electrical energy, heat transfer, acoustic levitation, uncertainty and robustness of infinite dimensional objects, fatigue failure prediction, autonomous navigation, nanotechnology and the analysis of technological development indexes. All applications, mathematical and computational tools and original results are presented using rigorous mathematical procedures. Further, the book gathers contributions by respected experts from 22 different research centers and eight countries: Brazil, Cuba, France, Hungary, India, Japan, Romania and Spain. The book is intended for use in graduate courses on applied computation, applied mathematics and engineering, where tools like computational intelligence and numerical methods are applied to the solution of real world problems in emerging areas of engineering.
