
History of Human-Computer Interaction

Human-computer interaction (HCI) is the interaction between people and computers, HCI developments make computers easier and more enjoyable for users to interact with – this area of study incorporates various study sectors such as psychology and physiology, which need to be implemented to understand how humans think and act, to be able to create the most effective interfaces. This includes the development of hardware and software that allows computerised technology to function, as well as the technology used in theme parks and to assist users with disabilities. The following is a brief timeline showing some of these developments.

1832 – Punch Cards:

The earliest form of computers stored data on paper cards that have holes punched into them via a punch card machine or by hand – these holes represent data. The holes are punched into each column of the punch card, with their placement showing what value the hole is; a punch card reader is used to read the data by reading vertically down each column.

1873 – QWERTY Layout:

It is believed the typewriter was developed to have its keys set out in the QWERTY layout to prevent the metal arms inside from clashing and getting stuck. QWERTY is used today by nearly all English computers and any other layout is very difficult for people to use as QWERTY has been natural since they were born.

1949 – The First Modem:

In 1949, a system was created that modulates digital data into recreated and demodulates sound into digital data for transfer. The modem was created at the Air Force Cambridge Research Center near Boston, Massachusetts, which was used in the SAGE Air Defense System ten years later to communicate with multiple radar stations and military. The modem was the start to the development of telephones, TV, and playing digital music.

1952 – Trackball:

The first trackball was invented by two Canadian engineers who wanted to create a better coordinate target data for their radar system. The trackball was a 4-inch Canadian duck pin bowling ball set in a socket with four disk and several rollers for movement and support, the device was developed and used in the military for weapon targeting which provided fast and precise movements. They were eventually used in a few video game controllers and computer mice, some computer mice still use trackballs as users do not have to move their hand but only their fingers which is preferred or beneficial to certain audiences, including those with disabilities in their hands.

1952 – A-O Compiler:

Grace Hopper created the first compiler, this allowed computer programs to use English letters and words to create programs instead of just numbers. People in the industry did not believe and did not change their arithmetic methods till two years later.
