Visual Memory Advances In Visual Cognition:

Visual Memory Steven J. Luck,Andrew Hollingworth,2008-09-10 Vision and memory are two of the most intensively studied topics in psychology and neuroscience This book provides a state of the art account of visual memory systems Each chapter is written by an internationally renowned researcher who has made seminal contributions to the topic **The Visual World in Memory** James R. Brockmole,2008-10-07 The book examines how well we remember what we see It pulls together the field with a series of chapters that concisely present the state of the science in all the areas of research

Visual Memory Timothy F. Brady,Wilma A. Bainbridge,2022-03-29 Featuring contributions from world leading researchers this book explores the relationship between visual perception and memory It bridges the traditionally separate fields of vision science and recognition memory and deals with an interdisciplinary set of perspectives combining research in psychology neuroscience and artificial intelligence The book makes new connections between the wealth of research from each respective field developing the idea that visuospatial memory is our best memory system This volume traverses topics grounded in both empirical study and real world applications including working short term memory long term memory the neuroscience of memory development of memory over the lifespan autobiographical memories false memories and eyewitness testimony It argues that an increased knowledge of how visuospatial memory works can lead to an improved understanding of the basic features of memory as well as providing strategies for memory improvement The book features cutting edge visual memory research where converging methods in psychophysics cognitive neuroscience and computational modeling have been propelling the field forward Visual Memory is an essential read for all students and researchers of memory and visual perception It will also be useful for researchers and students in related fields including human computer interaction data visualization cognitive science and cognitive enhancement Visual Memory Steven J. Luck,Andrew Hollingworth,2008-09-10 Vision and memory are two of the most intensively studied topics in psychology and neuroscience The present book concerns the interaction between vision and memory How do we remember what we see And how does our memory for the visual world influence subsequent perception and action topics in psychology and neuroscience and the intersection etween them visual memory is emerging as a fertile ground for research Certain memory systems appear to specialize in This book provides a state of the art account of visual memory systems Each chapter is written by an internationally renowned researcher who has made seminal contributions to the topic The chapters are comprehensive providing both a broad overview of each topic and a summary of the latest research They also present new perspectives that advance our theoretical understanding of visual memory and suggest directions for future research After an introductory overview by the editors chapters address visual sensory memory iconic memory visual short term memory and the relationship between visual memory and eye movements Visual long term memory is then reviewed from several different perspectives including memory for natural scenes the relationship between visual memory and object recognition and

associative learning The final chapters discuss the neural mechanisms of visual memory and neuropsychological deficits in visual memory This book is a comprehensive guide to visual memory research that will be a valuable resource for both students and professionals   **Visual Cognition** Glyn W. Humphreys,Vicki Bruce,1989 Vision allows us to do many things It enables us to perceive a world composed of meaningful objects and events It enables us to track those events as they take place in front of our eyes It enables us to read It provides accurate spatial information for actions such as reaching for or avoiding objects It provides colour and texture that can help us to separate objects from their background and so forth This book is concerned with understanding the processes that allow us to carry out these various visually driven behaviours In the past ten years our understanding of visual processing has undergone a rapid change primarily fostered by the convergence of computational experimental and neuropsychological work on the topic Visual Cognition provides the first major attempt to cover all aspects of this work within a single text It provides a state of the art summary of research on visual information processing relevant to advanced undergraduates postgraduates and research workers It covers seeing static forms object recognition dynamic vision motion perception and visual masking visual attention visual memory visual aspects of reading For each topic the relevant computational experimental and neuropsychological work is integrated to provide a broader coverage than that of other texts   *Change Blindness and Visual Memory* Daniel J. Simons,2018-12-02 A central goal in the study of object and scene perception is to understand how visual information is integrated across views to provide a stable continuous experience of our environment Research on issues ranging from visual masking to priming across saccades to the representation of spatial layout across views has addressed the issue of what information is preserved from one view to the next Recently research on visual memory for objects and scenes has led to striking claims about the nature of the information that is and is not preserved from one instant to the next For example studies of change blindness have shown that striking changes to objects and scenes can go undetected when they coincide with an eye movement a flashed blank screen a blink or an occlusion event These studies suggest that relatively little visual information about objects and scenes is combined across views Despite these failures of change detection observers somehow manage to experience a stable continuous visual environment This special issue seeks to unite recent studies of change blindness with studies of visual integration to better understand the nature of our representations and the richness of our visual memory   Change Blindness and Visual Memory Daniel J. Simons,2000-01-01 A central goal in the study of object and scene perception is to understand how visual information is integrated across views to provide a stable continuous experience of our environment Research on issues ranging from visual masking to priming across saccades to the representation of spatial layout across views has addressed the issue of what information is preserved from one view to the next Recently research on visual memory for objects and scenes has led to striking claims about the nature of the information that is and is not preserved from one instant to the next For example studies of change blindness have shown that striking changes to objects and scenes can go undetected when

they coincide with an eye movement a flashed blank screen a blink or an occlusion event These studies suggest that relatively little visual information about objects and scenes is combined across views Despite these failures of change detection observers somehow manage to experience a stable continuous visual environment This special issue seeks to unite recent studies of change blindness with studies of visual integration to better understand the nature of our representations and the richness of our visual memory   **Visual Cognition** Steven Pinker,1986-01-09 These essays tackle some of the central issues in visual cognition presenting experimental techniques from cognitive psychology new ways of modeling cognitive processes on computers from artificial intelligence and new ways of studying brain organization from neuropsychology to address such questions as How do we recognize objects in front of us How do we reason about objects when they are absent and only in memory How do we conceptualize the three dimensions of space Do different people do these things in different ways And where are these abilities located in the brain While this research which appeared as a special issue of the journal Cognition is at the cutting edge of cognitive science it does not assume a highly technical background on the part of readers The book begins with a tutorial introduction by the editor making it suitable for specialists and nonspecialists alike

Tutorials in Visual Cognition Veronika Coltheart,2011-01-07 In the late 1980s visual cognition was a small subfield of cognitive psychology and the standard texts mainly discussed just iconic memory in their sections on visual cognition In the subsequent two decades and especially very recently many remarkable new aspects of the processing of brief visual stimuli have been discovered change blindness repetition blindness the attentional blink newly discovered properties of visual short term memory and of the face recognition system the influence of reentrant processing on visual perception and the surprisingly intimate relationships between eyeblinks and visual cognition This volume provides up to date tutorial reviews of these many new developments in the study of visual cognition written by the leaders in the discipline providing an incisive and comprehensive survey of research in this dynamic field   **Facial Attractiveness** Leslie Zebrowitz,2001-10-30 Using evolutionary cognitive and social psychology this volume examines the issues raised by the question What makes some faces more attractive than others The authors challenge the views that beauty is simply in the eye of the beholder that it is idiosyncratic and that it is nothing more than an artifact of culture They argue instead that there are a variety of biological social motivational and developmental issues involved in facial attractiveness By exploring attractiveness and preference from these various perspectives this collection offers profound and unique insight on how and why we are attracted to certain facial types and how that attraction can influence our social interaction Some of the ideas presented in Facial Attractiveness are surprising others controversial and others even paradoxical Combined however they offer a new perspective on age old questions of attraction beauty and preference Each author challenges standard assumptions about beauty and encourages the reader to explore new trends in evolutionary social and cognitive psychology in search of a more coherent answer to the questions of what makes a face attractive and why   **Advances in Visual Cognition** ,19??

Understanding Events Thomas F. Shipley,Jeffrey M. Zacks,2008-02-25 We effortlessly recognize all sorts of events from simple events like people walking to complex events like leaves blowing in the wind We can also remember and describe these events and in general react appropriately to them for example in avoiding an approaching object Our phenomenal ease interacting with events belies the complexity of the underlying processes we use to deal with them Driven by an interest in these complex processes research on event perception has been growing rapidly Events are the basis of all experience so understanding how humans perceive represent and act on them will have a significant impact on many areas of psychology Unfortunately much of the research on event perception in visual perception motor control linguistics and computer science has progressed without much interaction This volume is the first to bring together computational neurological and psychological research on how humans detect classify remember and act on events The book will provide professional and student researchers with a comprehensive collection of the latest research in these diverse fields   **Bibliographic Index** ,2010   **Journal of Visual Impairment & Blindness** ,2006   *Human Vision, Visual Processing, and Digital Display* ,1995   **Verbalising Visual Memories** Toby J. b similarities and differences between effects of verbalisation and processing in the Navon task Navon 1977 and c effects of verbalisation in visual imagery and object memory It is clear that verbal processes influence the encoding storage and retrieval of visual information Moreover different forms of verbal interference and facilitation are likely to be due to different mechanisms in different contexts The state of the art is that we are just beginning to understand the rich complexity of the problem   *Cognitive Neuroscience Society ...
