Handbook of Applied Spatial Analysis Manfred M. Fischer, Arthur Getis, 2009-12-24 The Handbook is written for academics, researchers, practitioners and advanced graduate students. It has been designed to be read by those new or starting out in the field of spatial analysis as well as by those who are already familiar with the field. The chapters have been written in such a way that readers who are new to the field will gain important overview and insight. At the same time, those readers who are already practitioners in the field will gain through the advanced and/or updated tools and new materials and state of the art developments included. This volume provides an accounting of the diversity of current and emergent approaches not available elsewhere despite the many excellent journals and the books that exist. Most of the chapters are original; some few are reprints from the Journal of Geographical Systems, Geographical Analysis, The Review of Regional Studies and Letters of Spatial and Resource Sciences. We let our contributors develop from their particular perspective and insights their own strategies for mapping the part of terrain for which they were responsible. As the chapters were submitted, we became the first consumers of the project; we had initiated. We gained from the depth, breadth and distinctiveness of our contributors' insights and, in particular, the presence of links between them.

GIS and Spatial Analysis for the Social Sciences Robert Nash Parker, Emily K. Asencio, 2009-09-10 This is the first book to provide sociologists, criminologists, political scientists and other social scientists with the methodological logic and techniques for doing spatial analysis in their chosen fields of inquiry. The book contains a wealth of examples as to why these techniques are worth doing over and above conventional statistical techniques using SPSS or other statistical packages. GIS is a methodological and conceptual approach that allows for the linking together of spatial data or data that is based on a physical space with non spatial data which can be thought of as any data that contains no direct reference to physical locations.

Perspectives on Spatial Data Analysis Luc Anselin, Sergio J. Rey, 2009-12-24 Spatial data analysis has seen explosive growth in recent years. Both in mainstream statistics and econometrics as well as in many applied fields, the attention to space, location and interaction has become an important feature of scholarly work. The methods developed to deal with problems of spatial pattern recognition, spatial autocorrelation and spatial heterogeneity have seen greatly increased adoption in part due to the availability of user friendly desktop software. Through this theoretical and applied work, Arthur Getis has been a major contributing figure in this development. In this volume, we take both a retrospective and

a prospective view of the field We use the occasion of the retirement and move to emeritus status of Arthur Getis to highlight the contributions of his work In addition we aim to place it into perspective in light of the current state of the art and future directions in spatial data analysis To this end we elected to combine reprints of selected classic contributions by Getis with chapters written by key spatial scientists These scholars were specifically invited to react to the earlier work by Getis with an eye toward assessing its impact tracing out the evolution of related research and to reflect on the future broadening of spatial analysis The organization of the book follows four main themes in Getis contributions Spatial analysis Pattern analysis Local statistics Applications For each of these themes the chapters provide a historical perspective on early methodological developments and theoretical insights assessments of these contributions in light of the current state of the art as well as descriptions of new techniques and applications
