2.5 Membrane Permeability

What Can Cross the Membrane?

Types of molecules that cross the membrane:

- Small nonpolar molecules** (like O_2 and CO_2) can slip right through the phospholipid bilayer without any help. These molecules are small and nonpolar.
- Small polar uncharged molecules** like water can slip through the membrane in small amounts. Water molecules are very small and can slip between phospholipids. But the membrane is not very permeable to other small polar molecules.
- Large polar molecules and ions** (like glucose, amino acids, Na^+ , K^+ , and Cl^-) cannot cross the membrane on their own. They need transport proteins to help them cross. These molecules and ions typically cross through transport proteins in the membrane.

The hydrophobic tails of the phospholipids are the main barrier to the movement of molecules across the membrane. They repel water molecules and make it very challenging for small polar molecules to cross.

How Different Molecules Cross the Membrane

Molecule Type	Examples	Can Cross Easily?	Needs Transport Protein?
Small nonpolar	O_2 , CO_2 , N_2	Yes	No
Small polar uncharged	Water	Yes (limited)	No (large amounts)
Large polar	Glucose, amino acids	No	Yes
Ions	Na^+ , K^+ , Cl^-	No	Yes

1.5 Representing a Quantitative Variable with Graphs

Remember that a **quantitative variable** (or **quantitative variable**) refers to variables that can be measured and analyzed using statistical methods.

- A **discrete variable** can take on a limited number of values. The number of children in a family is an example of a discrete variable. Examples of discrete variables include the number of children in a family, the number of votes in an election, and the number of items in a collection.
- A **continuous variable** can take on an infinite number of values. Height, weight, and time are examples of continuous variables. Examples of continuous variables include the height of a person, the weight of a person, and the time it takes to run a mile.

This page will describe how to represent and display quantitative data. The following table is a summary of the key concepts you need to know for this topic. The goal is to help you understand the key concepts and how to represent them with graphs. The table is divided into two main sections: **Discrete Variables** and **Continuous Variables**. Each section contains a list of key concepts and a description of how to represent them with graphs.

3.5 The American Revolution

Remember the American Revolution? It was a major event in the history of the United States.

Causes of the American Revolution

The American Revolution was caused by a number of factors, including British taxation, British oppression, and British denial of rights.

- British taxation: The British government imposed taxes on the colonies, which the colonists viewed as unfair.
- British oppression: The British government treated the colonists as subjects, not as citizens.
- British denial of rights: The British government denied the colonists the right to a fair trial and the right to a jury.
- The growing sense of unity among the colonists: The colonists began to see themselves as a single people, rather than as separate colonies.
- The growing sense of patriotism among the colonists: The colonists began to feel a strong sense of loyalty to the United States.
- The growing sense of independence among the colonists: The colonists began to see themselves as a free people, rather than as subjects of the British crown.

The Boston Massacre

The Boston Massacre was a major event in the history of the American Revolution. It was the first time that British soldiers killed American civilians.

A group of British soldiers were standing on a street in Boston, and a group of American civilians were standing on the other side of the street. The British soldiers fired their guns, and five American civilians were killed.

The Boston Massacre was a major turning point in the history of the American Revolution. It led to the growing sense of unity among the colonists and the growing sense of patriotism among the colonists. It also led to the growing sense of independence among the colonists.

2.5 The Demographic Transition Model

Remember the Demographic Transition Model? It was a major concept in human geography.

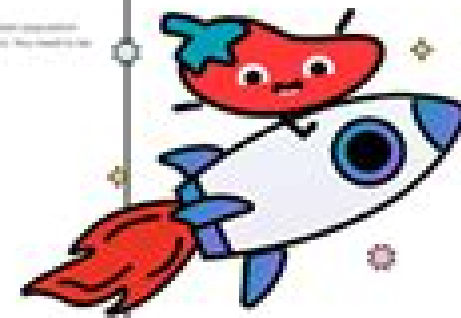

Demographic Transition Model

The Demographic Transition Model (DTM) is a model that describes the changes in a country's population over time. It is based on the idea that a country's population will grow rapidly in the early stages of development and then slow down as the country becomes more developed.

Stage 1

Stage 1 is the earliest stage of the DTM, characterized by high birth rates and high death rates. Because of this, the natural increase rate is close to zero. Population growth is slow. This stage is typical of countries that are poor and have low levels of development. The birth rate and the death rate are both high and close to each other.
