System On A Chip Verification System On A Chip Verification:

System-on-a-Chip Verification Prakash Rashinkar, Peter Paterson, Leena Singh, 2001 This is the first book to cover verification strategies and methodologies for SOC verification from system level verification to the design sign off All the verification aspects in this exciting new book are illustrated with a single reference design for Bluetooth application

System-on-Chip Security Farimah Farahmandi, Yuanwen Huang, Prabhat Mishra, 2019-11-22 This book describes a wide variety of System on Chip SoC security threats and vulnerabilities as well as their sources in each stage of a design life cycle The authors discuss a wide variety of state of the art security verification and validation approaches such as formal methods and side channel analysis as well as simulation based security and trust validation approaches This book provides a comprehensive reference for system on chip designers and verification and validation engineers interested in verifying security and trust of heterogeneous SoCs

Reuse Methodology Manual for System-on-a-chip Designs Michael Keating, Pierre Bricaud, 1999 Silicon technology now allows us to build chips consisting of tens of millions of transistors This technology not only promises new levels of system integration onto a single chip but also presents significant challenges to the chip designer As a result many ASIC developers and silicon vendors are re examining their design methodologies searching for ways to make effective use of the huge numbers of gates now available Design reuse the use of pre designed and pre verified cores is the most promising opportunity to bridge the gap between available gate count and designer productivity Reuse Methodology Manual for System On A Chip Designs Second Edition outlines an effective methodology for creating reusable designs for use in a System on a Chip SoC design methodology Silicon and tool technologies move so quickly that no single methodology can provide a permanent solution to this highly dynamic problem Instead this manual is an attempt to capture and incrementally improve on current best practices in the industry and to give a coherent integrated view of the design process

High-Level Verification Sudipta Kundu, Sorin Lerner, Rajesh K. Gupta, 2011-05-18 Given the growing size and heterogeneity of Systems on Chip SOC the design process from initial specification to chip fabrication has become increasingly complex This growing complexity provides incentive for designers to use high level languages such as C SystemC and SystemVerilog for system level design While a major goal of these high level languages is to enable verification at a higher level of abstraction allowing early exploration of system level designs the focus so far for validation purposes has been on traditional testing techniques such as random testing and scenario based testing This book focuses on high level verification presenting a design methodology that relies upon advances in synthesis techniques as well as on incremental refinement of the design process These refinements can be done manually or through elaboration tools This book discusses verification of specific properties in designs written using high level languages as well as checking that the refined implementations are equivalent to their high level specifications The novelty of each of these techniques is that they use a combination of formal techniques to do scalable verification of system designs completely automatically The verification

techniques presented in this book include methods for verifying properties of high level designs and methods for verifying that the translation from high level design to a low level Register Transfer Language RTL design preserves semantics Used together these techniques guarantee that properties verified in the high level design are preserved through the translation to low level RTL

Verification Methodology Manual for SystemVerilog Janick Bergeron, Eduard Cerny, Alan Hunter, Andy Nightingale, 2005-12-29 Functional verification remains one of the single biggest challenges in the development of complex system on chip SoC devices Despite the introduction of successive new technologies the gap between design capability and verification confidence continues to widen The biggest problem is that these diverse new technologies have led to a proliferation of verification point tools most with their own languages and methodologies Fortunately a solution is at hand SystemVerilog is a unified language that serves both design and verification engineers by including RTL design constructs assertions and a rich set of verification constructs SystemVerilog is an industry standard that is well supported by a wide range of verification tools and platforms A single language fosters the development of a unified simulation based verification tool or platform Consolidation of point tools into a unified platform and convergence to a unified language enable the development of a unified verification methodology that can be used on a wide range of SoC projects ARM and Synopsys have worked together to define just such a methodology in the Verification Methodology Manual for SystemVerilog This book is based upon best verification practices by ARM Synopsys and their customers Verification Methodology Manual for SystemVerilog is a blueprint for verification success guiding SoC teams in building a reusable verification environment taking full advantage of design for verification techniques constrained random stimulus generation coverage driven verification formal verification and other advanced technologies to help solve their current and future verification problems This book is appropriate for anyone involved in the design or verification of a complex chip or anyone who would like to know more about the capabilities of SystemVerilog Following the Verification Methodology Manual for SystemVerilog will give SoC development teams and project managers the confidence needed to tape out a complex design secure in the knowledge that the chip will function correctly in the real world

SOC Design Methodologies Michel Robert, Bruno Rouzeyre, Christian Pigué, Marie-Lise Flottes, 2013-03-15 The 11 th IFIP International Conference on Very Large Scale Integration in Montpellier France December 3 5 2001 was a great success The main focus was about IP Cores Circuits and System Designs 55 years ago in late 1947 the transistor was invented and everybody knows that it was by William Shockley John Bardeen and Walter H Brattain Bell Telephone Laboratories which received the Nobel Prize in Physics in 1956 Probably everybody thinks that it was recognized immediately as a major invention

Surviving the SOC Revolution Henry Chang, L.R. Cooke, Merrill Hunt, Grant Martin, Andrew McNelly, Lee Todd, 2007-05-08 The aim of Surviving the SOC Revolution A Guide to Platform Based Design is to provide the engineering community with a thorough understanding of the challenges involved when moving to system on a chip and deliver a step by step methodology to get them there Design reuse is most effective in

reducing the cost and development time when the components to be shared are close to the final implementation. On the other hand, it is not always possible or desirable to share designs at this level since minimal variations in specification can result in different, albeit similar, implementations. However, moving higher in abstraction can eliminate the differences among designs so that the higher level of abstraction can be shared and only a minimal amount of work needs to be carried out to achieve final implementation. The ultimate goal is to create a library of functions and of hardware and software implementations that can be used for all new designs. It is important to have a multilevel library since it is often the case that the lower levels that are closer to the physical implementation change because of the advances in technology while the higher levels tend to be stable across product versions. It is most likely that the preferred approaches to the implementation of complex embedded systems will include the following aspects. Design costs and time are likely to dominate the decision making process for systems designers. Therefore, design reuse in all its shapes and forms will be of paramount importance. Designs have to be captured at the highest level of abstraction to be able to exploit all the degrees of freedom that are available. Next generation systems will use a few highly complex Moore's Law Limited part types but many more energy power cost efficient medium complexity 10M-100M gates in 50nm technology chips working concurrently to implement solutions to complex sensing, computing and signaling/actuating problems. Such chips will most likely be developed as an instance of a particular platform. That is, rather than being assembled from a collection of independently developed blocks of silicon functionality, they will be derived from a specific family of micro architectures possibly oriented toward a particular class of problems that can be modified, extended or reduced by the system developer. These platforms will be highly programmable. Both system and software reuse impose a design methodology that has to leverage existing implementations available at all levels of abstraction. LIST This book deals with the basic principles of a design methodology that addresses the concerns expressed above. The platform concept is carried throughout the book as a unifying theme to reuse. This is the first book that deals with the platform based approach to the design of embedded systems and is a stepping stone for anyone who is interested in the real issues facing the design of complex systems on chip. From the Preface by Alberto Sangiovanni Vincentelli

Surviving the SOC Revolution , Co-verification of Hardware and Software for ARM SoC Design Jason

Andrews,2004-08-30 Hardware software co verification is how to make sure that embedded system software works correctly with the hardware and that the hardware has been properly designed to run the software successfully before large sums are spent on prototypes or manufacturing This is the first book to apply this verification technique to the rapidly growing field of embedded systems on a chip SoC As traditional embedded system design evolves into single chip design embedded engineers must be armed with the necessary information to make educated decisions about which tools and methodology to deploy SoC verification requires a mix of expertise from the disciplines of microprocessor and computer architecture logic design and simulation and C and Assembly language embedded software Until now the relevant information on how it all fits together has not been available Andrews a recognized expert provides in depth information about how co verification really works how to be successful using it and pitfalls to avoid He illustrates these concepts using concrete examples with the ARM core a technology that has the dominant market share in embedded system product design The companion CD ROM contains all source code used in the design examples a searchable e book version and useful design tools The only book on verification for systems on a chip SoC on the market Will save engineers and their companies time and money by showing them how to speed up the testing process while still avoiding costly mistakes Design examples use the ARM core the dominant technology in SoC and all the source code is included on the accompanying CD Rom so engineers can easily use it in their own designs

Software-centric and Interaction-oriented System-on-chip Verification Xiao Xi Xu, 2009 As the complexity of very large scale integrated circuits VLSI soars the complexity of verifying them increases even faster Design verification becomes the biggest bottleneck in VLSI design consuming around 70% of the effort and time in a typical design cycle The problem is even more severe as the system on chip SoC design paradigm is gaining popularity Unfortunately the development in verification techniques has not kept up with the growth of the design capability and is being left further behind in the SoC era In recent years a new generation of hardware modelling languages alongside the best practices to use them have emerged and evolved in an attempt to productively build an intelligent stimulation observation environment referred to as the test bench Ironically as test benches are becoming more powerful and sophisticated under these best practices known as verification methodologies the overall verification approaches today are still officially described as ad hoc and experimental and are in great need of a methodological breakthrough Our research was carried out to seek the desirable methodological breakthrough and this thesis presents the research outcome a novel and holistic methodology that brings an opportunity to address the SoC verification problems Furthermore our methodology is a solution completely independent of the underlying simulation technologies therefore it could extend its applicability into future VLSI designs Our methodology presents two ideas a We propose that system level verification should resort to the SoC native languages rather than the test bench construction languages the software native to the SoC should take more critical responsibilities than the test benches b We challenge the fundamental assumption that objects under test and tests are distinct entities instead they should be understood as one type of entities the interactions interactions together with the interference between interactions i e the parallelism and resource competitions should be treated as the focus in system level verification The above two ideas namely software centric verification and interaction oriented verification have yielded practical techniques This thesis elaborates on these techniques including the transfer resource graph based test generation method targeting the parallelism the coverage measures of the concurrency completeness using Petri nets the automation of the test programs which can execute smartly in an event driven manner and a software observation mechanism that gives insights into the system level behaviours
