California Riparian Systems Richard E.

Warner, Kathleen M. Hendrix, 2023-11-15 In California's semi arid environment the narrow lush strips of riparian habitats that border watercourses springs and seeps are critical ecosystems supporting a remarkable abundance of plant and animal life. These rich environments once thrived across the state from the Central Valley to the deserts of the Great Basin providing essential habitats for wildlife and acting as vibrant corridors in otherwise dry landscapes. However over time the expansion of agriculture and development has drastically altered these ecosystems. Today less than 10 percent of the original riparian vegetation remains with much of it degraded through logging, grazing and water diversion. This volume explores the unique ecological importance of California's riparian systems discussing the delicate balance between productive land use and the conservation of these critical habitats. California Riparian Systems brings together the latest research and insights from experts in ecology, conservation and land management to provide a comprehensive look at the challenges facing these fragile ecosystems. The book highlights the essential role riparian systems play in supporting diverse wildlife from the Yellow-billed Cuckoo and Bell's Vireo which nest exclusively in riparian thickets to aquatic mammals, reptiles, amphibians and fish that depend on the shelter and food provided by streamside vegetation. With growing public awareness and appreciation of the beauty and value of these areas this volume serves as both a call to action and a guide for sustainable management offering strategies to preserve and protect California's riparian systems while balancing agricultural and economic needs. This title is part of UC Press's Voices Revived program which commemorates University of California Press's mission to seek out and cultivate the brightest minds and give them voice, reach and impact. Drawing on a backlist dating to 1893, Voices Revived makes high quality peer-reviewed scholarship accessible once again using print-on-demand technology. This title was originally published in 1984.

Word Sense Selection in Texts Oi Yee Kwong, 2000 Abstract Early systems for word sense disambiguation WSD often depended on individual tailor-made lexical resources hand-coded with as much lexical information as needed but of severely limited vocabulary size. Recent studies tend to extract lexical information from a variety of existing resources e.g. machine-readable dictionaries, corpora for broad coverage. However, this raises the issue of how to combine the information from different resources. Thus, while different types of resource could make different contribution to WSD studies to date have not shown what contribution they make, how they should be combined and whether they are equally relevant to all words to be disambiguated. This thesis proposes an Integrated Model as a framework to study the interrelatedness of three major parameters in WSD: Lexical Resource, Contextual Information and Nature of Target Words. We argue that it is their interaction which shapes the effectiveness of any WSD system. A generalised, structurally based sense mapping algorithm was designed to combine various types of lexical resource. This enables information from these resources to be

used simultaneously and compatibly while respecting their distinctive structures. In studying the effect of context on WSD different semantic relations available from the combined resources were used and a recursive filtering algorithm was designed to overcome combinatorial explosion. We then investigated from two directions how the target words themselves could affect the usefulness of different types of knowledge. In particular we modelled WSD with the cloze test format i.e. as texts with blanks and all senses for one specific word as alternative choices for filling the blank. A full scale combination of WordNet and Roget's Thesaurus was done linking more than 30 000 senses. Using these two resources in combination a range of disambiguation tests was done on more than 60 000 noun instances from corpus texts of different types and 60 blanks from real cloze texts. Results show that combining resources is useful for enriching lexical information and hence making WSD more effective though not completely. Also different target words make different demand on contextual information and this interaction is closely related to text types. Future work is suggested for expanding the analysis on target nature and making the combination of disambiguation evidence sensitive to the requirements of the word being disambiguated.
