

was even smaller than bacteria and could cause infection. But he did not use the word 'virus' and he thought that the 'something' was probably a chemical. In 1898, a Dutch scientist called Beijerinck did further work on this subject and decided that 'viruses' were a liquid. It was some years later that an American scientist, Stanley, proved that they were very small particles.

Note that progress was slow because microscopes were not yet able to 'see' very small things such as viruses.

Topic 4.3 What is a species?

Exercise 4.3A Different species

White rhinoceroses and Indian rhinoceroses belong to different **species**. This means that they cannot **reproduce** with each other to produce **fertile** offspring.

White rhinoceroses and Indian rhinoceroses do not look **exactly the same** as one another. Indian rhinoceroses have one **horn** but white rhinoceroses have two **horns**.

Exercise 4.3B Horses, donkeys and mules

1. Horses and donkeys are different species. They cannot breed together to produce fertile offspring. However, a horse and a donkey can breed to produce a mule. Mules are infertile.
2. Horses and donkeys are different species. They cannot breed together to produce fertile offspring. However, a horse and a donkey can breed to produce a mule. Mules are infertile.
3. Horses and donkeys are different species. They cannot breed together to produce fertile offspring. However, a horse and a donkey can breed to produce a mule. Mules are infertile.

Exercise 4.3C A new frog species

There is a new species of frog in the rain forest. It is different from all other species of frog. The scientists who discovered it have named it 'Xenopus'.

They have decided that it is a new species because it is different from all other species of frog. They have also decided that it is a new species because it is different from all other species of frog.

Look for these features in the students' answers.

- An appreciation of the importance of using several specimens to study, because of variation within a species, but that studying too many of the frogs might endanger the species, especially if these are not returned to their natural habitat.
- A clear, simple description or list of what evidence the scientists should collect. This could include information about observable features, such as coloration, measurements of body parts, behaviour and perhaps a study of its genes, and that these should be compared with the same features in other similar frog species. Some students might also suggest studying the tadpole, to see if they differ in any way from the tadpoles of the other species.
- Reference to the ability of this frog to breed with known species of frog to produce fertile offspring.
- Suggestions about how the scientists could use their information to test their hypothesis that the frog belongs to a new species, such as investigating whether the newly-found frogs can breed with other similar species, as well as making a detailed comparison of their appearance with these other species.

Topic 4.4 Using frogs

Exercise 4.4A Using a frog to identify a frog

There are two species of frog.

Exercise 4.4B Using a frog to identify a frog

1. A frog is a frog.
2. A frog is a frog.
3. A frog is a frog.
