

INTRODUCTION

Our brains grow from a single cell, the fertilized egg that carries genetic information from our parents. How is that genetic code used to build the brain and how do genes and the environment interact during brain growth? At the other end of life there are other questions to consider. How do we avoid brain disease and keep our brains in optimal health?

The structure of the nervous system is far too complex for the genetic code to specify the position and connections of every single nerve cell. Genes that control the development of the brain act as regulators switching on or off key developmental processes (e.g., the set of genes that generate the nerve and glial cells and setting gene products for the interactions between nerve cells). Much of the complex structure of the adult nervous system is actually the result of competition between nerve cells in the brain at all stages. Many different types of nerve cells are produced in greater numbers than will survive to adulthood. Nerve cells must compete through their genes for growth factors from larger structures and those cells that win get little support and die. The connections between brain regions are also formed through a competitive process which ensures that the most effective connections persist those that are maintained into adulthood.

MATURITY AND THE AGING BRAIN

There are inevitable changes in the brain as we age. These mainly involve the gradual loss of connections between nerve cells, rather than the loss of nerve cell bodies themselves. Some of these lost connections may have been redundant anyway and so not necessarily cause a reduction in functional ability. The greater experience of mature brains can also counterbalance some of the effects of cell loss, especially in the 50s and 60s (see later). On the other hand, the loss of connections accelerates as we reach our 70s and 80s and we gradually lose speed of action in both our whole body and brain functions. The gradual and relentless loss of sensory receptors may degrade one of the basic and areas of first and enable the ability to balance our body and mind fails. These effects can compound and accelerate the normal aging process so that loss of function in one area makes it difficult to retain function in other areas.

MAINTAINING BRAIN HEALTH

Many of the degenerative processes that reduce our brain function as we age can be lessened by maintaining an active lifestyle. By training the memory circuitry and decreasing the production of growth factors, physical and mental activity help to slow the loss of memory, motor, and cognitive function. Physical activity also slows down the process of atherosclerosis that narrows the arteries to the brain.

ENVIRONMENTAL FACTORS IN BRAIN DEVELOPMENT

The developing brain is extremely sensitive to environmental factors at all stages of development. These relate to the environment of the womb, after the embryo, perhaps not to be exposed to substances in unusual amounts or temperatures, or later to specific dietary, sensory, or mental factors. In a complex area of factors that are important during life after birth (nutrition, disease, experience, and intellectual stimulation),

FIGURE 10.1 The central nervous system is composed of the brain and spinal cord. They are shown in the figure as they appear in the 60-year-old. The surface of each cell carries the gene information that is not true to the embryonic nervous system and other parts of the body.

Matthew William Pitts,Peter R. Hoffmann,Lutz Schomburg,2022-02-18 *Metabonomics and Gut Microbiota in Nutrition and Disease* Sunil Kochhar,François-Pierre Martin,2014-10-21 This book provides a comprehensive overview of metabonomics and gut microbiota research from molecular analysis to population based global health considerations The topics include the discussion of the applications in relation to metabonomics and gut microbiota in nutritional research in health and disease and a review of future therapeutical nutraceutical and clinical applications It also examines the translatability of systems biology approaches into applied clinical research and to patient health and nutrition The rise in multifactorial disorders the lack of understanding of the molecular processes at play and the needs for disease prediction in asymptomatic conditions are some of the many questions that system biology approaches are well suited to address

Achieving this goal lies in our ability to model and understand the complex web of interactions between genetics metabolism environmental factors and gut microbiota Being the most densely populated microbial ecosystem on earth gut microbiota co evolved as a key component of human biology essentially extending the physiological definition of humans Major advances in microbiome research have shown that the contribution of the intestinal microbiota to the overall health status of the host has been so far underestimated Human host gut microbial interaction is one of the most significant human health considerations of the present day with relevance for both prevention of disease via microbiota oriented environmental protection as well as strategies for new therapeutic approaches using microbiota as targets and or biomarkers In many aspects humans are not a complete and fully healthy organism without their appropriate microbiological components Increasingly scientific evidence identifies gut microbiota as a key biological interface between human genetics and environmental conditions encompassing nutrition Microbiota dysbiosis or variation in metabolic activity has been associated with metabolic deregulation e g obesity inflammatory bowel disease disease risk factor e g coronary heart disease and even the aetiology of various pathologies e g autism cancer although causal role into impaired metabolism still needs to be established Metabonomics and Gut Microbiota in Nutrition and Disease serves as a handbook for postgraduate students researchers in life sciences or health sciences
