

- The effect of back EMF on current and torque is shown that when a DC motor starts, the back EMF is high and hence current flows through the coil in loops and reacts to the supply current. As the coil rotates faster, the back EMF increases so the total current flowing through the motor is reduced. Once the motor is in motion, due to mechanical resistance in the motor, the back EMF is never equal to the supply EMF.
- Due to mechanical resistance in the motor, the back EMF is never equal to the supply EMF. The increase in total current with decrease in speed makes a motor self-regulating to some extent.

Initial or T_{max} $T_{max} = I^2 R$

maximum generated power of motor for given EMF supply

Output torque input to motor from mechanical resistance of coil

speed (RPM)

Ex 20. when Energy

When the motor is running at high revolutions, the back EMF is large and the current passing through the coil is small. Therefore the motor is protected from the risk of burning.

$$T = \frac{V}{R} I \quad V_{DC} \rightarrow I \propto \frac{1}{R}$$

relative speed
increases

However, a motor at start-up has no back EMF. It can draw too much current and overheat and burnout. $V = I \cdot R \quad I = \frac{V}{R} \propto V \propto I \cdot R$

- To protect the motor on start-up, an adjustable starting resistor is placed in the circuit.
- The resistor is removed when the motor's speed increases.

$$V = IR, \quad I = \frac{V}{R}$$

- The mechanism of back EMF ensures that an electric motor runs more slowly and consumes energy at a slower rate.

This is due to the decreasing rate of change of high initial torque which results in a lower acceleration and a lower final power output.

The motor's energy must come from the electric supply. It therefore has less energy than the supply that it receives.

Consider an ideal motor with no friction. The energy transformation depends on rotation speed as summarised below:

	Low speed	Maximum speed
Back EMF	Low	Equal to supply EMF
Total EMF		
Total current		
Total torque	High	Zero
Power from power supply ($P = VI$)		
Result	Coil accelerates	Coil rotates at constant speed
Energy transformation	Electrical energy is taken from the power supply and increases the mechanical energy of the coil	The energy taken from the power supply is converted into mechanical energy of the coil

Recall that torque is analogous to force

- An object travels at constant velocity when the net force is zero.
- An object rotates at constant speed when the net torque is zero.

Note that the above is an ideal case – in reality, there will be friction (such as friction) in the motor that means it will always have some constant velocity.

↳ due to friction between fixed and rotating parts
