The SAGE Handbook of Developmental Disorders Patricia Howlin, Tony Charman, Mohammad Ghaziuddin, 2011-01-31

Over the last four decades breakthroughs in genetic knowledge together with the emergence of disciplines devoted to the scientific study of developmental disorders have resulted in much greater awareness of the many different behavioural and genetic phenotypes involved. It is now evident that not only do different disorders have different causes and different manifestations but different neurological and biochemical bases, different responses to intervention and different life courses. Reflecting the enormous changes that have taken place in our knowledge and understanding of developmental disorders, this groundbreaking international volume brings this vast and complex field together for the first time. The Editors have collected together the world's leading academic scholars and clinicians to explore how current research across a range of different disciplines can inform clinical practice and help to improve the lives of individuals and their families. **Harrison's**

systems emerge from the complex nature of the genome A key aspect of genome complexity can be attributed to the process of alternative splicing of precursor mRNA or pre mRNA during which introns are removed and exons are selectively spliced together This highly regulated process generates different mature mRNA transcripts from a single gene and is widespread throughout the eukaryotic evolution The majority of the genes expressed in the mammalian central nervous system undergo extensive alternative splicing Some genes can generate more than a thousand isoforms resulting in diverse proteoforms that can differ in their function binding preference catalytic activity and localization Perturbation in alternative splicing has been linked to many neurological disorders Despite its significance we still lack a comprehensive understanding of its role in neuronal function Recent studies suggest that alternative splicing is a regulator of tissue identity and development This is particularly relevant to the brain where developmental regulation and heterogenous cell population play a crucial role in shaping its function For a long time technological limitations in detecting and measuring alternatively spliced transcripts hindered the progress in understanding the biology of alternative splicing Recent advances in long read and native mRNA sequencing and robust computational tools allow us to capture and quantify in their full length form Public transcriptomics datasets can be utilized for the meta analysis of alternative splicing landscapes of various experimental conditions and disease samples In addition protein isoform detection complements mRNA isoform levels Given its biological significance and recent advances the objective of this Research Topic is to assemble current knowledge views and challenges in the studies of alternative splicing in brain function
