Dialogues in Music Therapy and Music Neuroscience: Collaborative Understanding Driving Clinical Advances Julian O'Kelly,Jörg C. Fachner,Mari Tervaniemi,2017-06-30 Music is a complex dynamic stimulus with an unparalleled ability to stimulate a global network of neural activity involved in attention emotion memory communication motor co ordination and cognition As such it provides neuroscience with a highly effective tool to develop our understanding of brain function connectivity and plasticity Increasingly sophisticated neuroimaging technologies have enabled the expanding field of music neuroscience to reveal how musical experience perception and cognition may support neuroplasticity with important implications for the rehabilitation and assessment of those with acquired brain injuries and neurodegenerative conditions Other studies have indicated the potential for music to support arousal attention and emotional regulation suggesting therapeutic applications for conditions including ADHD PTSD autism learning disorders and mood disorders In common with neuroscience the music therapy profession has advanced significantly in the past 20 years Various interventions designed to address functional deficits and health care needs have been developed alongside standardised behavioural assessments Historically music therapy has drawn its evidence base from a number of contrasting theoretical frameworks Clinicians are now turning to neuroscience which offers a unifying knowledge base and frame of reference to understand and measure therapeutic interventions from a biomedical perspective Conversely neuroscience is becoming more enriched by learning about the neural effects of real world clinical applications in music therapy While neuroscientific imaging methods may provide biomarking evidence for the efficacy of music therapy interventions it also offers important tools to describe time locked interactive therapy processes and feeds into the emerging field of social neuroscience Music therapy is bound to the process of creating and experiencing music together in improvisation listening and reflection Thus the situated cognition and

experience of music developing over time and in differing contexts is of interest in time series data We encouraged researchers to submit papers illustrating the mutual benefits of dialogue between music therapy and other disciplines important to this field particularly neuroscience neurophysiology and neuropsychology The current eBook consists of the peer reviewed responses to our call for papers
