energy The explanations are entirely non mathematical using many color pictures and clear concepts In this way the reader is led to a much deeper understanding than any popular science book can provide The author has written this book for everyone who wants to go beyond superficial descriptions of relativity s remarkable phenomena but is not equipped to read the professional literature and complicated math behind the theory By providing a complete description in terms of concepts and pictures the book answers many questions about why the theory works as it does For example it explains why and how momentum and pressure are related to gravity why and how mass causes spacetime to curve and how curvature tells objects how to move it also reveals the origin of the ring seen around the first ever image of a black hole Not least the reader will learn in detail how gravitational waves are produced and measured Since their conception the theories of relativity have appealed to the public s imagination Thanks to this book readers now have the opportunity to convert their fascination with the topic to a deep understanding

**Wayfinding Behavior** Reginald G. Golledge,1999-01-14 The metaphor of a cognitive map has attracted wide interest since it was first proposed in the late 1940s Researchers from fields as diverse as psychology geography and urban planning have explored how humans process and use spatial information often with the view of explaining why people make wayfinding errors or what makes one person a better navigator than another Cognitive psychologists have broken navigation down into its component steps and shown it to be an interplay of neurocognitive functions such as spatial updating and reference frames or perception action couplings But there has also been an intense debate among biologists over whether animals have cognitive maps or have other forms of internal spatial representations that allow them to behave as if they did Yet until now little has been done to relate research on human and non human subjects in this area In Wayfinding Behavior Cognitive Mapping and Other Spatial Processes Reginald Golledge brings together a distinguished group of scholars to offer a unique and comprehensive survey of current research in these diverse fields Among the common themes they discover is the psychologists black box approach in which the internal mechanisms of spatial perception and route planning are modeled or constructed like metaphors based on the behavioral evidence Cognitive neuroscientists on the other hand have attempted to discover the neurocognitive basis for spatial behavior They have shown

for example that damage in the hippocampus system invariably impairs the ability of animals and humans to learn about remember and navigate through environments and studies in humans show that neurons in this system code for location direction and distance thereby providing the elements needed for a mapping system Artificial intelligence and robotics theorists attempt to construct intelligent mapping systems using computer technology In these areas there is growing evidence that as in human wayfinding processes useful representations cannot be achieved without sacrificing completeness and precision Wayfinding Behavior Cognitive Mapping and Other Spatial Processes offers not only state of the art knowledge about wayfinding but also represents a point of departure for future interdisciplinary studies The more we know concludes volume editor Reginald Golledge about how humans or other species can navigate wayfind sense record and use spatial information the more effective will be the building of future guidance systems and the more natural it will be for human beings to understand and control those systems
