**Latent Variable Analysis and Signal Separation** Emmanuel Vincent, Arie Yeredor, Zbyněk Koldovský, Petr Tichavský, 2015-08-14 This book constitutes the proceedings of the 12th International Conference on Latent Variable Analysis and Signal Separation LVA ICS 2015 held in Liberec Czech Republic in August 2015. The 61 revised full papers presented 29 accepted as oral presentations and 32 accepted as poster presentations were carefully reviewed and selected from numerous submissions. Five special topics are addressed: tensor based methods for blind signal separation, deep neural networks for supervised speech separation, enhancement joined analysis of multiple datasets, data fusion and related topics, advances in nonlinear blind source separation, sparse and low rank modeling for acoustic signal processing.

**Model-Based Signal Processing** James V. Candy, 2005-10-13 A unique treatment of signal processing using a model based perspective. Signal processing is primarily aimed at extracting useful information while rejecting the extraneous from noisy data. If signal levels are high then basic techniques can be applied. However, low signal levels require using the underlying physics to correct the problem causing these low levels and extracting the desired information. Model based signal processing incorporates the physical phenomena measurements and noise in the form of mathematical models to solve this problem. Not only does the approach enable signal processors to work directly in terms of the problem's physics, instrumentation and uncertainties, but it provides far superior performance over the standard techniques. Model based signal processing is both a modeler's as well as a signal processor's tool. Model Based Signal Processing develops the model based approach in a unified manner and follows it through the text in the algorithms, examples, applications and case studies. The approach coupled with the hierarchy of physics based models that the author develops, including linear as well as nonlinear representations, makes it a unique contribution to the field of signal processing. The text includes parametric e.g. autoregressive or all pole sinusoidal wave based and state space models as some of the model sets, with its focus on how they may be used to solve signal processing problems. Special features are provided that assist readers in understanding the material and learning how to apply their new knowledge to solving real life problems. Unified treatment of well known signal processing models including physics based model sets. Simple applications demonstrate how the model based approach works while detailed case studies demonstrate problem solutions in their entirety from concept to model development through simulation, application to real data and detailed performance analysis. Summaries provided with each chapter ensure that readers understand the key points needed to move forward in the text as well as MATLAB® Notes that describe the key commands and toolboxes readily available to perform the algorithms discussed. References lead to more in depth coverage of specialized topics. Problem sets test readers' knowledge and help them put their new skills into practice. The author demonstrates how the basic idea of model based signal processing is a highly effective and natural way to solve both basic as well as complex processing problems. Designed as a graduate level text, this book is also essential reading for practicing signal processing professionals and scientists who

will find the variety of case studies to be invaluable An Instructor s Manual presenting detailed solutions to all the problems in the book is available from the Wiley editorial department **Applied Mechanics Reviews** ,1989 **Water Resources Engineering** William H. Keesman, 2011-05-16 System Identification shows the student reader how to approach the system identification problem in a systematic fashion. The process is divided into three basic steps: experimental design and data collection, model structure selection and parameter estimation, and model validation, each of which is the subject of one or more parts of the text. Following an introduction on system theory, particularly in relation to model representation and model properties, the book contains four parts covering data based identification, non parametric methods for use when prior system knowledge is very limited, time invariant identification for systems with constant parameters, time varying systems, identification primarily with recursive estimation techniques, and model validation methods. A fifth part composed of appendices covers the various aspects of the underlying mathematics needed to begin using the text. The book uses essentially semi physical or gray box modeling methods, although data based transfer function system descriptions are also introduced. The approach is problem based rather than rigorously mathematical. The use of finite input output data is demonstrated for frequency and time domain identification in static, dynamic, linear, nonlinear, time invariant and time varying systems. Simple examples are used to show readers how to perform and emulate the identification steps involved in various control design methods, with more complex illustrations derived from real physical, chemical and biological applications being used to demonstrate the practical applicability of the methods described. End of chapter exercises for which a downloadable instructors Solutions Manual is available from [fill in URL](#) here will both help students to assimilate what they have learned and make the book suitable for self tuition by practitioners looking to brush up on modern techniques. Graduate and final year undergraduate students will find this text to be a practical and realistic course in system identification that can be used for assessing the processes of a variety of engineering disciplines. System Identification will help academic instructors teaching control related to give their students a good understanding of identification methods that can be used in the real world without the encumbrance of undue mathematical detail.

Modeling dynamical systems theory, methodology and applications. Lennart Ljung's System Identification Theory for the User is a complete, coherent description of the theory, methodology and practice of System Identification.
