

When a rod is held with nylon, a PVC, or glass, electrons move in, or out, of the rod. The rod has been charged but by induction. Even though the rod is being treated as neutral, the rod keeps its charge. Why? (as presented in 2 principles of electrostatics)

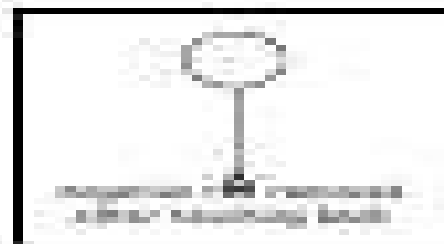

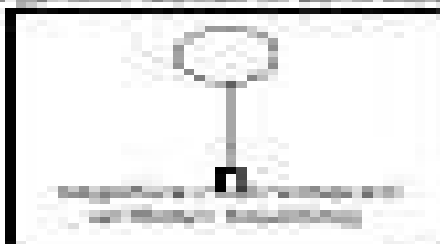

1. When the rod touches the metal sphere, electrons move to the left, induced because electrons repel electrons. Once contact and separation are as far as possible, in the first diagram, draw an arrow showing the direction the electrons move. When the rod is removed, the sphere is left with a net charge. The process is charging by conduction and is called contact. In the second diagram, draw the net charge on the sphere.

2. The following series involves a positively charged diverging rod. In each case, draw the arrangement that charge distribution has had.

3. Charging a metal sphere without touching is called induction. The side of the object closest to the charging distribution is charged that is (like same as, opposite) that of the diverging rod. The process is charging by induction.

4. Draw the lines on the electrostatic lines, and use if positive and if negative charges show the charge distribution in each case.

good knowledge of these parameters generation of static charge can be minimized During production static potential on a moving web can cause web breakage ignition of flammable atmosphere or shock risk The main objective of this research is to develop a method to measure static electricity on moving nonwoven machine belts In this project the instruments to measure and eliminate static potential on moving fabrics design of test apparatus relationship between charge decay values and charge generation of different fabrics static potential measurements under different conditions are discussed Spunbond technology is one of the nonwoven production methods have a high static charge generation problem tests were done by using a spunbond belt on an actual spunbond machine These belts are mostly made of woven fabrics with different structures different number of layers fabric design structure of polymers used A goal of manufacturing these belts is to reduce static electricity during production Among all parameters that cause static charge generation tension is the most important one A small amount of increase in tension can double the charge on belt Separation is also a reason for charge generation and as roller fabric friction increases because of the increased contact area more charge will be generated during separation A new parameter contact area also needs to be considered Static charge generation may not be same at cross direction on a belt As all areas are in the same situation working and environment conditions the only thing that was different was the tension Because of the spunbo
