

WK 7 : Overview of the digestive system

Functions of the Gastro intestinal system

- Food is **broken down (via mechanic/chemical digestion)** into its smallest components and **absorbed into the blood**
- Ingested nutrients, vitamins and minerals are used to
 - **produce energy**
 - **drive metabolic processes**
 - **synthesize hormones**
- Has a critical role in **fluid, electrolyte, and acid-base homeostasis** by taking in **water and electrolytes via the diet (water in = water out)**.
- **Excretion of metabolic wastes in faeces.**

Organs of the GI SYSTEM

- Digestive system
 - set of organs that breaks down food items into **nutrients that can be delivered by bloodstream to cells in body**
 - Organs located from head to abdominopelvic cavity
 - Ingested nutrients, vitamins and minerals are used to **produce energy (ATP), drive metabolic processes, and synthesize hormones**
 - The digestive system consists of **two types of organs: organs of gastrointestinal (GI) tract (also known as the alimentary canal) and accessory organs**
- Organs of GI tract
 - A continuous tube through which food passes. Starts at the oral cavity and ends at the rectum
- Accessory organs
 - Assist in digestion in some way, but are **not part of the GI tract**, and typically don't come in direct contact with food

Basic Digestive Processes

- **Mastication** – **chewing** starts the mechanical breakdown of food (teeth/tongue)
- **Ingestion/Propulsion** – swallowing, peristalsis and segmentation
- **Secretions** - from endocrine and exocrine organs aid digestive processes
- **Mechanical Digestion** – food is physically broken down using movement
- **Chemical Digestion** – food (bonds) is chemically broken down using enzymes
- **Absorption** – transfer of nutrients from the gut to the blood circulation
- **Defaecation** – expulsion of undigested material and waste products

Tissues of the GI tract

- Digestive organs of GI tract follow **same general tissue pattern**
