*Multicore Programming and Applications/DSP Systems*

## Abstract

As application complexity continues to grow, we have reached a limit on increasing performance by merely scaling clock speed. To meet the ever-increasing processing demand, modern System-On-Chip solutions contain multiple processing cores. The dilemma is how to map applications to multicore devices. In this paper, we present a programming methodology for converting applications to run on multicore devices. We also describe the features of Texas Instruments DSPs that enable efficient implementation, execution, synchronization, and analysis of multicore applications.

Physical Layer Multi-Core Prototyping Maxime Pelcat, Slaheddine Aridhi, Jonathan Piat, Jean-François Nezan, 2012-08-11

Base stations developed according to the 3GPP Long Term Evolution LTE standard require unprecedented processing power. 3GPP LTE enables data rates beyond hundreds of Mbits/s by using advanced technologies necessitating a highly complex LTE physical layer. The operating power of base stations is a significant cost for operators and is currently optimized using state of the art hardware solutions such as heterogeneous distributed systems. The traditional system design method of porting algorithms to heterogeneous distributed systems based on test and refine methods is a manual thus time expensive task. Physical Layer Multi Core Prototyping A Dataflow Based Approach provides a clear introduction to the 3GPP LTE physical layer and to dataflow based prototyping and programming. The difficulties in the process of 3GPP LTE physical layer porting are outlined with particular focus on automatic partitioning and scheduling load balancing and computation latency reduction specifically in systems based on heterogeneous multi core Digital Signal Processors. Multi core prototyping methods based on algorithm dataflow modeling and architecture system level modeling are assessed with the goal of automating and optimizing algorithm porting. With its analysis of physical layer processing and proposals of parallel programming methods which include automatic partitioning and scheduling Physical Layer Multi Core Prototyping A Dataflow Based Approach is a key resource for researchers and students. This study of LTE algorithms which require dynamic or static assignment and dynamic or static scheduling allows readers to reassess and expand their knowledge of this vital component of LTE base station design.

**Multi-Core Embedded Systems** Georgios Kornaros, 2018-10-08 Details a real world product that applies a cutting edge multi core architecture. Increasingly demanding modern applications such as those used in telecommunications networking and real time processing of audio video and multimedia streams require multiple processors to achieve computational performance at the rate of a few giga operations per second. This necessity for speed and manageable power consumption makes it likely that the next generation of embedded processing systems will include hundreds of cores while being increasingly programmable blending processors and configurable hardware in a power efficient manner. Multi Core Embedded Systems presents a variety of perspectives that elucidate the technical challenges associated with such increased integration of homogeneous processors and heterogeneous multiple cores. It offers an analysis that industry engineers and professionals will need to understand the physical details of both software and hardware in embedded architectures as well as their limitations and potential for future growth. Discusses the available programming models spread across different abstraction levels. The book begins with an overview of the evolution of multiprocessor architectures for embedded applications and discusses techniques for autonomous power management of system level parameters. It addresses the use of existing open source and free tools originating from several application domains such as traffic modeling graph theory parallel computing and network simulation. In addition the authors cover other important topics associated with multi core

embedded systems such as Architectures and interconnects Embedded design methodologies Mapping of applications
