Do You Know the Five Main Warning Signs of a Stroke? Heart and Stroke Foundation of Canada, 2000* *The DEMON Called STROKE* Sarah J Goodridge, 2024-03-30 A stroke occurs when blood supply to the brain is interrupted with a blood clot or blocked artery being the culprit in around 80% of cases Damage to the blood arteries themselves is another potential cause

of strokes as brain cells cannot get enough oxygen for optimum functioning without sufficient blood flow. The length of time a stroke causes a halt is directly proportional to the severity of its effects. A mini stroke also known as a transient ischemic attack (TIA) happens when a blood vessel briefly becomes blocked. Approximately four out of every ten patients who encounter a TIA will have a stroke. A big stroke may result in serious symptoms including long term difficulties due to damage to brain cells. A stroke may be fatal if not obtained quick medical assistance. The sooner you get therapy the better your chances of a successful recovery. Causes of stroke include oxygen and nourishment which can lead to disability, major brain damage or even death. There are two primary forms of strokes: ischemic stroke which accounts for 85% of all stroke cases and hemorrhagic strokes which involve the rupture of a blood artery that supplies the brain. A transient ischemic attack (TIA) is a rare type of stroke in which the blood supply to the brain is abruptly disturbed. To identify early warning signs of a stroke remember the FAST acronym which includes facial drooping, arm weakness or numbness and speech issues. These symptoms can develop rapidly but it does not mean you will not have time to react. Some people exhibit symptoms such as headaches, numbness or tingling several days before experiencing a major stroke. If you feel you or someone else is suffering from a TIA or stroke, obtain medical assistance at once. A stroke is a medical emergency and the sooner you receive treatment the better your chances of a successful recovery. Treatment will be chosen by the type of stroke, the affected area of the brain and the severity of the symptoms. Long term treatment may be required to avoid future strokes and aid in recovery. Strokes can occur anywhere including at a dinner table or during a party. Recognizing the signs of a stroke is crucial for saving someone's life. The first step is to learn to notice these unmistakable indicators such as face drooping, lack of arm control and slurred speech. When caring for someone undergoing a stroke, follow these dos and don'ts:

- 1 Don't drive to the hospital, call paramedics. Responding paramedics may be sent to a recognized stroke center with experienced doctors available 24/7.
- 2 Do not give the person aspirin as it can worsen many strokes. A CT scan is necessary to determine which group a stroke victim belongs to.
- 3 Do not serve the person food or water as stroke may interfere with muscle control, especially swallowing.
- 4 Dial 911 immediately as every minute that the brain is deprived of oxygen leads to the death of roughly 1.9 million neurons.
- 5 Use the word stroke when interacting with the emergency dispatcher as it gives paramedics and the hospital more time to prepare.
- 6 Write down the time as knowing when symptoms initially arose can help doctors choose the appropriate course of treatment.
- 7 Help the person lie down as a stroke may result in confusion, problems controlling movement and even paralysis.
- 8 Loosen restricting clothes, avoid twisting or straining weak limbs, check for a pulse and breathing and perform CPR if necessary.
- 9 Unlock the front door ensuring access to the prospective stroke patient.
- 10 Keep calm and remain by the person's side, reassure them that relief is on its way.

Khaku,2020 Stroke is a leading cause of mortality and morbidity worldwide Just a decade ago stroke management was simple Apart from secondary prevention and education there was not much a clinician could do that would significantly change outcomes There were no acute interventions no tPA and no endovascular therapies Stroke was thus not an emergency Today we live in a different world With the advent of tPA and endovascular intervention acute stroke is an emergency of epic proportions Time literally is brain and the clinician has to be acutely aware of the advances in stroke in order to maximize the therapeutic impact Many books have been written about stroke The authors and editors envisioned a succinct yet comprehensive guide for the clinician in the management of stroke From the medical management of stroke to neuroimaging thrombolysis endovascular therapies and rehabilitation this book guides the novice clinician as well as the seasoned vascular neurologist to be able to recognize manage and treat acute stroke to the best of medical science s guidelines *Reducing preventable deaths: Health education and policy* Georgi Iskrov,Amelia Kekeletso Ranotsi,2023-07-27 **The Lancet** ,1872
