**Be** P. Eng Subramonian,2010-07 The awareness of proper tire inflation among motorists has increased exponentially due the safety and benefits could be earned in return This book presents Automatic Tyre Pressure Controller ATPC which limits pressure in the tire regardless of pressure set on the kiosk ATPC can be used with manual inflators compressors where it will automatically alert user upon reaching appropriate tire pressure ATPC has won few innovation medals and awards internationally To make tremendous advancement and improvement on ATPC the authors researchers have innovated a technique device called Automatic Tyre Inflation System ATIS which can automatically autonomously inflate tires to the desired precise pressure while the car is on move Thus the user could benefit three in one featured device in coming nearest future The conceptual design of ATIS has been a center of attraction in innovation exhibitions with its unique and beneficial features The principals sketches designs and concepts of ATPC and ATIS are illustrated clearly in this book This work can benefit engineering developers of tire inflation technology which is dominant for motoring safety and profitable business

**Experimental Investigation of Truck Tire Inflation Pressure on Pavement-tire Contact Area and Pressure Distribution** University of Texas at Austin. Center for Transportation Research,1985      *Tires* Charles E. Rabuse,2013 Proper tire inflation is important for several reasons Underinflated tires experience a greater amount of sidewall flexion than properly inflated tires resulting in decreased fuel economy sluggish handling longer stopping distances increased stress to tire components and heat build up that can lead to catastrophic failure of the tire such as cracking component separation or blow out These catastrophic failures can cause loss of vehicle control and may result in a crash This book presents an analysis of the data collected through the Tire Pressure Monitoring System Special Study TPMS SS as it pertains to the effectiveness of TPMS in promoting proper tire inflation      *Tire Pressure Systems - Management (CTIS) Type For Medium and Heavy Duty Highway Vehicles* Truck and Bus Tire Committee,2012 This SAE recommended practice defines the system and component functions measurement metrics testing methodologies for evaluating the functionality and performance of ground vehicle CTIS Systems of this type allow the driver to select the operational tire pressure set point TPSP based on off highway conditions and upon returning to highway operations maintain the inflation pressure to the vehicle specified level These systems are recommended to address all serviceable tires as originally installed on a vehicle by the OEM and or specialty vehicle manufacturer and for the aftermarket including replacement or spare parts are recommended but optional

to address all tire rim combinations installed after initial vehicle sale or in use dates Systems for use by military and some other very rigorous off road applications require such extreme performance requirements particularly at very high and low temperature and other combat based extremes that such applications may fall outside the recommended parameters of the subject document In those cases it is the responsibility of the procuring customer vehicle OEM and applicable component s OEM to determine what compromises might be required and the suitability of design and performance solutions that may be outside of those recommended here This document is applicable to all axle and all wheel combinations for the following vehicle types but does not preclude its use on other vehicle types single unit powered vehicles exceeding 7257 kg 16 000 US lbs gross vehicle weight rating GVWR and multi unit vehicle combinations up to three 3 towed units which use an SAE J560 connector for power and or communication or equivalent successor connector technology For combination vehicles including two or more trailers the dolly axles are also included The included vehicles can be newly manufactured vehicles or existing vehicles fitted with air or hydraulic braking systems Special Note Equipment known as dual tire equalizers are commonly used with this category of vehicles When installing a CTIS system dual tire equalizers systems are not recommended as they run counter to the purpose of the management system NOTE The following systems are not being addressed in this edition of the subject document 1 Tire Pressure Monitoring Systems these systems have been addressed under SAE J2848 1 2 Tire Pressure Maintenance Systems these systems have been addressed under SAE J2848 2 Within the medium and heavy duty vehicle industry the equipment supplier community has responded to the need to manage inflation pressure for greater vehicle operational performance when transitioning from improved roadways to unimproved roadways and back by developing onboard adjustable tire pressure systems The central tire inflation system CTIS is one such system Through a CTIS the vehicle driver from the cab position is capable of selecting a pressure level based on the ground flotation conditions and the vehicle load for uninterrupted operations Because operators will expect these systems to provide the selected level of pressure and to maintain that level of pressure especially as the vehicle returns to highway operations it is important that all marketed systems respond with a minimum level of performance to assure continued in service safety In the off road or unimproved roadway environment the driver typically will operate at a reduced vehicle speed and may choose a reduced tire inflation pressure Under these conditions it is important to maintain a balance between the tire s flotation performance at high deflection and the tire s durability These characteristics are particular to each tire manufacturer s product and therefore it is not practical to define one universal set of operating criteria nor a singular limiting threshold for the off road environment At the same time when these vehicles return to highway operations it is expected that tire pressure systems of this category having survived the harsh environments to which they were exposed will be able to bring the tire s inflation pressure back to the specified highway pressure level and maintain it For both SAE document SAE J2848 1 and SAE J2848 2 the system performance and communications to the driver functions have been made coherent and consistent Under this

document it is essential that the driver communications and performance thresholds especially when operating to highways conditions also be consistent with the document series Each management system must still keep the driver informed of the status of the pressure level and make him aware when the system installed is no longer performing its intended function This document captures the attributes of pressure management systems while retaining the alerts and warnings so vitally important to the driver

Central Tire Inflation R. B. Rummer,1990      **Tire Pressure Systems - Maintenance (ATIS)**

**Type For Medium and Heavy Duty Highway Vehicles** Truck and Bus Tire Committee,2023 This SAE Recommended Practice defines the system and component functions measurement metrics and testing methodologies for evaluating the functionality and performance of ground vehicle tire pressure maintenance ATIS systems systems which automatically restore the inflation pressure to its specified level and recommended maintenance practices for these systems within the known operating environments These systems are recommended to address all serviceable tires as originally installed on a vehicle by the OEM and or specialty vehicle manufacturer and for the aftermarket including replacement or spare parts are recommended but optional to address all tire rim combinations installed after initial vehicle sale or in use dates This document is applicable to all axle and all wheel combinations for the following vehicle types single unit powered vehicles exceeding 7257 kg 16 000 lb gross vehicle weight rating GVWR and multi unit vehicle combinations up to three towed units which use an SAE J560 connector for power and or communication or equivalent successor connector technology For combination vehicles including two or more trailers the dolly axles are also included The included vehicles can be newly manufactured vehicles or existing vehicles fitted with air or hydraulic braking systems SPECIAL NOTE Equipment known as dual tire equalizers are commonly used with this category of vehicles When employing an ATIS system dual tire equalizers systems are not recommended as they run counter to the purpose of the maintenance system NOTE The following systems are not being addressed in this edition of the subject document 1The management system types and more mature complex versions of maintenance and management types to include on board reporting storage retrieval data control capabilities will be addressed separately by future changes additions to this document series 2Tire pressure monitoring systems These systems have been addressed under SAE J2848 1 Today the world of mobility is served extensively by tires which are pneumatic in design To function correctly these tire designs need pneumatic pressure to derive their performance characteristics optimum tread wear fuel economy ride quality or fatigue life hence the value of keeping the retained pressure at design levels ranks high While periodic inspection and the periodic action of adjusting the inflation pressure while a vehicle is at rest has been the norm for maintaining pressure the need to hold tire inflation pressures closer to their design targets over time even while operating a vehicle on the open road at highway speeds becomes apparent The minimum performance capabilities recommended in the following document support these needs Within the medium and heavy duty vehicle industry the equipment supplier community has responded to the need to maintain inflation pressure by developing

various tire pressure systems which automatically re inflate the tire wheel assemblies even while operating on the highway Because these systems do not require any intervention or action by the operator operators will eventually come to rely upon these systems to maintain tire inflation pressure It is therefore important that all marketed systems provide an adequate level of performance to assure continued in service safety Tires and wheels are integral components of tire pressure systems The system attributes for tire pressure systems described herein assume an appropriate fitment of tire and wheel for each application and that these tire pressure systems are not dependent on the performance or physical characteristics of the tire or wheel components The substitution of one tire wheel assembly for another tire wheel assembly of another configuration appropriate for the vehicle system shall not render the tire pressure system inoperative so long as it provides a pneumatic chamber for the inflation gas Under SAE J2848 1 the system functions and performance expectations for tire pressure monitoring systems have been established The subject document SAE J2848 2 addresses tire pressure maintenance systems for which it is essential that the performance and communications to the driver be consistent with that established for tire pressure monitoring systems see Figure 1 SAE J2848 2 has been reaffirmed to comply with the SAE Five Year Review policy While tire pressure maintenance systems do not relieve the driver of his immediate responsibility to take the recommended maintenance action these systems must still keep the driver informed of the status of the pressure level and make him aware when the system applied is no longer performing its intended function This document incorporates the attributes of pressure maintenance systems into the management of tire inflation pressure while retaining the alerts and warnings so vitally important to the driver
