Time-Varying Systems and Computations Patrick DeWilde, Alle-Jan van der Veen, 1998-06-30 Complex function theory and linear algebra provide much of the basic mathematics needed by engineers engaged in numerical computations signal processing or control The transfer function of a linear time invariant system is a function of the complex variable  $s$  or  $z$  and it is analytic in a large part of the complex plane Many important properties of the system for which it is a transfer function are related to its analytic properties On the other hand engineers often encounter small and large matrices which describe linear maps between physically important quantities In both cases similar mathematical and computational problems occur operators be they transfer functions or matrices have to be simplified approximated decomposed and realized Each field has developed theory and techniques to solve the main common problems encountered Yet there is a large mysterious gap between complex function theory and numerical linear algebra For example complex function theory has solved the problem to find analytic functions of minimal complexity and minimal supremum norm that approximate given values at strategic points in the complex plane They serve approximants for a desired behavior of a system to be designed No similar approximation theory for matrices existed until recently except for the case where the matrix is very close to singular

*Time-varying System Theory and Computational Modeling* Alle-Jan van der Veen, 1993 *Matrix Diagonal Stability in Systems and Computation* Eugenius Kaszkurewicz, Amit Bhaya, 2012-12-06 This monograph presents a collection of results observations and examples related to dynamical systems described by linear and nonlinear ordinary differential and difference equations In particular dynamical systems that are susceptible to analysis by the Liapunov approach are considered The naive observation that certain diagonal type Liapunov functions are ubiquitous in the literature attracted the

attention of the authors and led to some natural questions Why does this happen so often What are the special virtues of these functions in this context Do they occur so frequently merely because they belong to the simplest class of Liapunov functions and are thus more convenient or are there any more specific reasons This monograph constitutes the authors synthesis of the work on this subject that has been jointly developed by them among others producing and compiling results properties and examples for many years aiming to answer these questions and also to formalize some of the folklore or culture that has grown around diagonal stability and diagonal type Liapunov functions A natural answer to these questions would be that the use of diagonal type Liapunov functions is frequent because of their simplicity within the class of all possible Liapunov functions This monograph shows that although this obvious interpretation is often adequate there are many instances in which the Liapunov approach is best taken advantage of using diagonal type Liapunov functions In fact they yield necessary and sufficient stability conditions for some classes of nonlinear dynamical systems **Hybrid**
