

## CE5504 – Surface Water Quality Modeling

### A Toxic Substance Model for a Well-Mixed Lake

To this point, we have dealt with what are often termed conventional pollutants, e.g. nitrogen, phosphorus, organic carbon, etc. Now our attention will move to toxic substances, substances which differ from conventional pollutants in several ways important to the modeler:

- natural versus alien: problems relating to conventional pollutants typically involve the natural cycle of organic production and decomposition, most often over stimulation of natural processes. Toxic substances do not occur naturally and the problem is one of interference with natural processes.
- aesthetics versus health: a case could be made that mitigation of problems relating to conventional pollutants largely seeks to eliminate aesthetic problems. Although such a case would be overstated, it is clear that management of toxic substances focuses on health concerns, e.g. drinking water and aquatic food stuffs.
- few versus many: conventional water quality management deals with on the order of ten "pollutants". In contrast, there are tens of thousands of organic chemicals that may be introduced to the environment.
- single versus multiple phase: conventional pollutants are largely modeled as single species, although some partitioning is made between the dissolved and particulate phases. Such partitioning is critical for modeling toxic substances, because they tend to exist in gaseous, dissolved and particulate phases.

It is the liquid/solid partitioning which most significantly impacts the manner in which toxic substances are modeled. A mechanistic treatment of partitioning is important because key source/sink processes act selectively on either the dissolved or particulate form. For example, volatilization acts solely on the dissolved form, settling only on the particulate form, and decay reactions on both.

Mathematically, the total contaminant concentration ( $\text{mg}\cdot\text{m}^{-3}$ ) is given by,

$$C = C_d + C_p$$

where  $c_d$  is the dissolved component and  $c_p$  is the particulate component, each representing a fixed fraction of the total concentration,

$$c_d = F_d \cdot C$$

Vanrolleghem, 2001-05-31 Selected Proceedings of the 5th International Symposium on Systems Analysis and Computing in Water Quality Management Held in Gent Belgium 18 20 September 2000 The focus of the IWA Specialist Group on Systems Analysis and Computing is essentially methodological. Its goal is to foster discussion of the interdisciplinary issues cutting across the many topics of interest within IWA. Consequently the themes of the symposium did not reflect specific concerns with sewers or wastewater treatment or river basin management or surface water quality or groundwater contamination. Rather the symposium was organised along the lines of new models decision support systems uncertainty and risk analysis integrated urban wastewater systems operations and control sensors and monitoring optimal experimental design methodologies model selection and calibration techniques and time series analysis. Evidently the papers may each have case specific aspects but they also highlight matters of methodology that are common to all with a distinctly interdisciplinary character. There was an open call for papers resulting in abstracts from 30 countries around the world. Papers for oral and poster presentation at the symposium were selected by the Programme Committee from full papers. They were reviewed again and 47 of them were finally included in these proceedings. Notably 8 of the contributions were selected among the posters through a competition announced prior to the Symposium. The collection of papers in these proceedings are a comprehensive update that will prove invaluable for those working in the fields of environmental engineering river basin management aquatic ecology process optimisation data mining planning and monitoring.
