quantum physics yet even though it has only 10 15 of the volume of the atom the nucleus contains more than 99 9 of the mass of the atom the nucleus is very small but very massive that was not predicted try to imagine the surprise and disbelief of scientists in 1911 when ernest rutherford discovered this incredible fact

over 3 000 different kinds of atomic nuclei have been discovered in elements that span the periodic table yet each one has

unique properties some may exist forever others transform within a fraction of a second some can power satellites as they travel to the outer reaches of the solar system others have special properties that allow them to treat different forms of cancer

radioactivity some nuclides have an atomic nucleus that decays spontaneously without any external influence known as radionuclides they transform themselves into other nuclei ionising radiation is emitted during this process this is known as radioactivity

atomic physics deals with the atom as a system consisting of a nucleus and electrons nuclear physics deals with the nucleus

as a system consisting of nucleons protons and neutrons the main difference is in the scale while the term atomic deals with  $1\text{Å}$   $10^{-10}\text{ m}$  where Å is an ångström according to anders jonas Ångström the term
