Trends In Differential Geometry, Complex Analysis And Mathematical Physics - Proceedings Of 9th International Workshop On Complex Structures, Integrability And Vector Fields Stanko Dimiev, Vladimir S Gerdjikov, Kouei Sekigawa, 2009-08-21

This book contains the contributions by the participants in the nine of a series of workshops. Throughout the series of workshops the contributors are consistently aiming at higher achievements of studies of the current topics in complex analysis differential geometry and mathematical physics and further in any intermediate areas with expectation of discovery of new research directions. Concerning the present one it is worthwhile to mention that in addition to the new developments of the traditional trends many attractive and pioneering works were presented and their results were contributed to the present volume. The contents of this volume therefore will provide not only significant and useful information for researchers in complex analysis differential geometry and mathematical physics including their related areas but also interesting mathematics for non specialists and a broad audience. The present volume contains new developments and trends in the studies on constructions of holomorphic Cliffordian functions the swelling constructions of minimal surfaces with higher genus in flat tori the spectral properties of soliton equations on symmetric spaces new types of shallow water waves described by Camassa Holm type equations the properties of pseudo hermitian boson and fermion coherent states fractals and chaos on orthorhombic lattices and even an ambitious proposal of a graph model for Kaehler manifolds with Kaehler magnetic fields

Bobenko, 2016-08-12 This is one of the first books on a newly emerging field of discrete differential geometry and an excellent way to access this exciting area It surveys the fascinating connections between discrete models in differential geometry and complex analysis integrable systems and applications in computer graphics The authors take a closer look at discrete models in differential geometry and dynamical systems Their curves are polygonal surfaces are made from triangles and quadrilaterals and time is discrete Nevertheless the difference between the corresponding smooth curves surfaces and classical dynamical systems with continuous time can hardly be seen This is the paradigm of structure preserving discretizations Current advances in this field are stimulated to a large extent by its relevance for computer graphics and mathematical physics This book is written by specialists working together on a common research project It is about differential geometry and dynamical systems smooth

and discrete theories and on pure mathematics and its practical applications The interaction of these facets is demonstrated by concrete examples including discrete conformal mappings discrete complex analysis discrete curvatures and special surfaces discrete integrable systems conformal texture mappings in computer graphics and free form architecture This richly illustrated book will convince readers that this new branch of mathematics is both beautiful and useful It will appeal to graduate students and researchers in differential geometry complex analysis mathematical physics numerical methods discrete geometry as well as computer graphics and geometry processing *Several Complex Variables V* G.M.

Khenkin,2012-12-06 In this part we present a survey of mean periodicity phenomena which arise in connection with classical questions in complex analysis partial differential equations and more generally convolution equations A common feature of the problem we shall consider is the fact that their solutions depend on techniques and ideas from complex analysis One finds in this way a remarkable and fruitful interplay between mean periodicity and complex analysis This is exactly what this part will try to explore It is probably appropriate to stress the classical flavor of all of our treatment Even though we shall frequently refer to recent results and the latest theories such as algebraic analysis or the theory of Bernstein Sato polynomials it is important to observe that the roots of probably all the problems we discuss here are classical in spirit since that is the approach we use For instance most of Chap 2 is devoted to far reaching generalizations of a result dating back to Euler and it is soon discovered that the key tool for such generalizations was first introduced by Jacobi As the reader will soon discover similar arguments can be made for each of the subsequent chapters Before we give a complete description of our work on a chapter by chapter basis let us make a remark about the list of references It is quite hard maybe even impossible to provide a complete list of references on such a vast topic

International Workshop on Complex Structures,

processes the phenomena of Bose Einstein condensates etc The symmetries of these MNLS equations are also studied as well as their reductions and Lie algebraic properties The third part of these proceedings treats problems of contemporary mechanics and mathematical physics The methods of differential geometry quite unexpectedly provide important tool for modeling and studying microinjections in cell membranes the equilibrium
