Compartmentation of Plant Metabolism in

Non-Photosynthetic Tissues M. J. Emes, 1991-02-21 Many of the most important plant crop products including oils starch and protein are produced in non photosynthetic tissues such as seeds roots and tubers Unlike the situation found in leaves metabolism in these tissues is not necessarily dominated by plastidial activities and the provision of energy for biosynthetic processes is therefore different from that in green cells In this book leading researchers in the field present a fine overview of the latest thinking on the organisation of metabolism in such organs and the development of the cellular compartments responsible for the synthesis of important crop products Graduate students as well as researchers in the field of plant biochemistry will find this book of great interest

Division and Segregation of Organelles Stephen A. Boffey, David Lloyd, 1988 These editors provide a stimulating survey of the ways in which mitochondria plastids and other cellular organelles replicate The orderly division and segregation of these organelles is essential for the survival of all eukaryotes and is therefore a topic of importance to a wide range of biologists from geneticists via physiologists to molecular biologists The first part of the volume examines the mechanism regulation and consequences of organelle segregation and division as studied in plant and animal cells The second part compares the replication of DNA in eukaryote organelles with bacterial processes Reviews range from a comparative study of DNA polymerases to the possible mechanisms ensuring DNA segregation

Discoveries in Photosynthesis Govindjee, J.T. Beatty, H. Gest, J.F. Allen, 2006-07-15 Life Is Bottled Sunshine Wynwood Reade Martyrdom of Man 1924 This inspired phrase is a four word summary of the significance of photosynthesis for life on earth The study of photosynthesis has attracted the attention of a legion of biologists biochemists chemists and physicists for over 200 years Discoveries in Photosynthesis presents a sweeping overview of the history of photosynthesis investigations and detailed accounts of research progress in all aspects of the most complex bioenergetic process in living organisms Conceived of as a way of summarizing the history of research advances in photosynthesis as of millennium 2000 the book evolved into a majestic and encyclopedic saga involving all of the basic sciences The book contains 111 papers authored by 132 scientists from 19 countries It includes overviews timelines tributes minireviews on excitation energy transfer reaction centers oxygen evolution light harvesting and pigment protein complexes electron transport and ATP synthesis techniques and applications biogenesis and membrane architecture reductive and assimilatory processes transport regulation and adaptation Genetics and Evolution laboratories and national perspectives and retrospectives that end in a list of photosynthesis symposia books and conferences Informal and formal photographs of scientists make it a wonderful book to have This book is meant not only for the researchers and graduate students but also for advanced undergraduates in Plant Biology Microbiology Cell Biology Biochemistry Biophysics and History of Science

Plant Promoters and

Transcription Factors Lutz Nover, 2013-06-29 The control of plant gene expression at the transcriptional level is the main subject of this volume Genetics molecular biology and gene technology have dramatically improved our knowledge of this event The functional analysis of promoters and transcription factors provides more and more insights into the molecular anatomy of initiation complexes assembled from RNA polymerase and the multiplicity of helper and control proteins Formation of specific DNA protein complexes activating or repressing transcription is the crux of developmental or environmental control of gene expression The book presents an up to date critical overview of this rapidly advancing field

Cell Organelles Reinhold G. Herrmann, 2012-12-06 The compartmentation of genetic information is a fundamental feature of the eukaryotic cell The metabolic capacity of a eukaryotic plant cell and the steps leading to it are overwhelmingly an endeavour of a joint genetic cooperation between nucleus cytosol plastids and mitochondria Alter ation of the genetic material in anyone of these compartments or exchange of organelles between species can seriously affect harmoniously balanced growth of an organism Although the biological significance of this genetic design has been vividly evident since the discovery of non Mendelian inheritance by Baur and Correns at the beginning of this century and became indisputable in principle after Renner s work on interspecific nuclear plastid hybrids summarized in his classical article in 1934 studies on the genetics of organelles have long suffered from the lack of respectabil ity Non Mendelian inheritance was considered a research sideline ifnot a freak by most geneticists which becomes evident when one consults common textbooks For instance these have usually impeccable accounts of photosynthetic and respiratory energy conversion in chloroplasts and mitochondria of metabolism and global circulation of the biological key elements C N and S as well as of the organization maintenance and function of nuclear genetic information In contrast the heredity and molecular biology of organelles are generally treated as an adjunct and neither goes as far as to describe the impact of the integrated genetic system **Plant**

Photosynthesis David W. Lawlor, 1993 Provides a simplified description of the partial process of photosynthesis at the molecular organelle cell and organ levels of organization in plants which contribute to the complete process It surveys effects of global environmental change carbon dioxide enrichment and ozone depletion **Light-Harvesting Antennas in**

Photosynthesis Beverley Green, W.W. Parson, 2003-09-30 Light Harvesting Antennas in Photosynthesis is concerned with the most important process on earth the harvesting of light energy by photosynthetic organisms This book provides a comprehensive treatment of all aspects of photosynthetic light harvesting antennas from the biophysical mechanisms of light absorption and energy transfer to the structure biosynthesis and regulation of antenna systems in whole organisms It sets the great variety of antenna pigment protein complexes in their evolutionary context and at the same time brings in the latest

hi tech developments The book is unique in the degree to which it emphasizes the integration of molecular biological biochemical and biophysical approaches Overall a well organized understandable and comprehensive volume It will be a valuable resource for both graduate students and their professors and a helpful library reference book for undergraduates
